NOTES

EPIGRAPH

1 Penfield 1965–6.

2 Plotinus (third century AD), *Enneads*, Bk VI, Tractate IV, §14.

INTRODUCTION

1 Wittgenstein 1984 (54e).

2 This myth is best known in the West from Goethe's poem 'Der Zauberlehrling'. The magus is overheard by his apprentice casting a spell; the apprentice tries it himself when his master is away, getting the broom and bucket to fetch water for him, and is delighted with his newfound power – until he finds that though he could set things in motion, he has no way of stopping them again. The magus returns and casts a spell just in time to save his apprentice from drowning. So fundamental is this myth to the experience of being human that it exists in one form or another in almost every society that has been studied across five continents (Thompson 1946).

3 Schrödinger 1951 (5). Rather more movingly, Plotinus writes: ἡμεῖς δέ – τίνας δὲ ἡμεῖς; 'But we – who *are* we?' (see epigraph).

4 Jonas 2001 (196).

5 Waismann 1968 (33).

6 Maudlin 1998.

7 Henry 2005.

8 Waismann 1968 (20).

9 Plato, *Epistles*, VII, 341c (trans J Harward).

10 Yeats, 'Among schoolchildren'.

11 Heschel 1997 (176): 'In the eyes of him whose first category is the category of quantity, one man is less than two men, but in the eyes of God one life is worth as much as all of life'.

12 The illustration here is adapted from a helpful analogy provided by Jan Zwicky (personal communication), and recapitulates a point made by Wittgenstein in *Philosophical Investigations*.

13 Thus Harold Bloom (2003, 12) says of Shakespeare that he was 'a consciousness shaped by all the consciousnesses that he imagined' and 'his consciousness can seem more the product of his art than its producer'. In a similar vein, Aaron Copland says that 'the reason for the compulsion to renewed creativity, it seems to me, is that each added work brings with it an element of self-discovery. I must create in order to know myself ...' (Copland 1952, 41).

14 Fichte 1991 (90).

15 Lavelle 1939, ch 9, §7: « *La charité est ... une pure attention à l'existence d'autrui.* »

16 One demonstration of how blind we can be to the obvious forms the basis of a particularly ingenious clip, featuring Agatha Christie's detective Hercule Poirot, which was a successful cycling safety ad for Transport for London, with over 9 million hits on YouTube: www.youtube.com/watch?v=ubNF9QNEQLA (accessed 23 February 2021)

17 With one exception: the global/local distinction, in support of which I here do cite the research. This is because it is of central importance, and I understated the evidence base in *The Master and his Emissary*: there can be no room for scepticism here.

18 The four main theories are these: (1) facilitation of avoidance behaviour: eg, a threat from the right half of space causes the salamander *Amblystoma* to coil away from it, which requires an instant response by left-sided musculature – see, eg, Bullock & Horridge 1965, vol 1, 57–8, and Sarnat & Netsky 1981; (2) reversal of optical imagery: optical imagery being both vertically and *horizontally* reversed, decussation yields 'close central association between the primary visual inputs from the

hemispace and the central somatic centres subserving the hemibody oriented to the visual hemispace’ – the retina is embryologically part of the brain (Ramón y Cajal 1899; see also Capozzoli 1995); (3) information processing: ‘as the number of wiring connections grows, decussated arrangements become overwhelmingly more robust against wiring errors than seemingly simpler same-sided wiring schemes’ (Shinbrot & Young 2008); and (4) axial rotation in the development of vertebrates, the idea being that the relocation of the neuraxis from the ventral to the dorsal aspect of the body proceeded by means of a twisting of the body 180 degrees on its axis just behind its anterior pole (Kinsbourne 2013). But, as I say, no-one ultimately can be sure, and nothing hangs on it, with regard to the message of this book, either way.

19 Even the neonate is very far from being a blank slate.

[51](#) Commissurotomy (or callosotomy) is the procedure for severing the corpus callosum, producing a so-called split brain. This was a revolutionary operation pioneered in California in the 1960s for the treatment of subjects with intractable epilepsy, since it prevented a storm of abnormal electrical activity in one hemisphere spreading to the whole brain. It also gave psychologists an unparalleled opportunity to investigate one hemisphere at a time. As the contemporary neuroscientist Stanislas Dehaene puts it: 'Patients with a severed corpus callosum are a gold mine for neuropsychologists because they allow for a systematic assessment of the cognitive abilities available in each hemisphere' (Dehaene 1997, 182).

- 74** See Kavcic, Fei, Hu *et al* 2000 (81), who pinpoint the tectum of the midbrain: ‘The tonic and/or phasic status of the several modulatory systems of the brainstem seem fully capable of apportioning their effects to favour one or the other hemisphere in gaining ascendancy in metacontrol ... The superior colliculus seems a likely focal point for such interhemispheric effects’. Jack Pettigrew has researched the phenomenon extensively, and his conclusions are argued for at some length in an interesting paper (Pettigrew 2001). He locates the ‘switch’ in the tegmentum (ventral tegmental area, or VTA), rather than the tectum, but still in the midbrain.

- 85** Braun & Suffren 2011.
- 86** See Roland Puccetti (1989): ‘Those sceptics about mental duality who give the safe rejoinder that it is ablation of the forebrain commissures which creates double mindedness in patients manifesting the disconnection syndrome, so that its symptoms tell us nothing about the organization of consciousness in normal subjects, must ask themselves how it is possible one half of a formerly healthy (except for proneness to epileptic seizures in many cases) brain – the half that does not even think in language – should be able to perform transparently intentional and purposeful acts ... Such

acts require, at the very least, memory, foresight, and anticipation of probable responses from the dominant, speaking hemisphere. Did these characteristically human psychological capacities arise *de novo* from the disconnection, or were they not previously present but suppressed by the unconscious inhibitory influence of the speech hemisphere, acting through the intact corpus callosum? The latter seem a far more parsimonious explanation of the behaviour Bogen has described.'

1. SOME PRELIMINARIES: HOW WE GOT HERE

1 Voltaire, 'Le Mondain', 1736: 'the superfluous, that very necessary thing, has reunited the hemispheres'. Of course Voltaire was not speaking of neurology, but of the coming together, through trading items of luxury, of the Western and Eastern hemispheres; but it has a curious aptness here.

- 52** The difference between presence in the right hemisphere and re-presentation in the left is at the core of this phenomenon. See Seger, Poldrack, Prabhakaran *et al* 2000: ‘In the present study [of visual concept learning], the right hemisphere frontal and parietal activations were present from the beginning and persisted throughout learning. They did not differ reliably in learners and non-learners. Thus, the right hemisphere activations appear to be related to constant processes of visuo-spatial analysis of *stimulus specifics that are dissociable from categorical learning*. Indeed, such right hemisphere processes would have to be insulated from categorical knowledge in order to maintain their focus on stimulus-specific properties, and it is to be expected that this focus would be maintained across the task. Left-hemisphere activation occurred as participants learned abstract categories applicable to the specific stimuli ...’ (1323: emphasis added).

2. ATTENTION

1 Tarnas 2006 (16).

2 Thoreau 1906, vol 2 (373): journal entry for 5 August 1851.

3 Blake, letter to the Revd John Trusler, 23 August 1799.

4 Hillis & Tippet 2014.

5 Right hemisphere and attention in general: see, eg, Heilman & van den Abell 1980; Shulman, Pope, Astafiev *et al* 2010; Longo, Trippier, Vagnoni *et al* 2015; Valsangkar-Smyth, Donovan, Sinnott *et al* 2004; Kingstone 2016; Petit, Simon, Joliot *et al* 2007. Right hemisphere and switching attention: Okada, Sato, Kubota *et al* 2012; Okada, Sato & Toichi 2006; Verleger, Sprenger, Gebauer *et al* 2009; Hodgson, Chamberlain, Parris *et al* 2007.

6 Flöel, Buyx, Breitenstein *et al* 2005; Mevorach, Humphreys & Shalev 2005. When both global attention and language lateralise, unusually, *in the same direction* (more commonly in left- or mixed-handers), it is commoner for language to lateralise, along with attention, to the right hemisphere than for attention to lateralise, along with language, to the left hemisphere. Thus the association between the right hemisphere and global attention is the ‘last to go’. All patterns can, however – if rarely – be found. On language lateralisation in left-handers, see Pujol, Deus, Losilla *et al* 1999.

19 Simons & Levin 1998. This was the original academic study. More dramatic instances have been engineered by, for example, the illusionist Derren Brown: www.wimp.com/person-swapping-social-experiment-by-derren-brown/ (accessed 3 November 2017).

20 Boeschoten, Kemner, Kenemans *et al* 2005; Kenemans, Baas, Mangun *et al* 2000; first noted by Lange (1936).

21 A vivid demonstration of this phenomenon in a dog following a right hemisphere stroke is available on YouTube: www.youtube.com/watch?v=hHo-y7WJIU.

22 Bareham, Bekinschtein, Scott *et al* 2015. See also, eg, Mosidze, Mkheidze & Makashvili 1994 (74 out of 150 patients with RH damage, 1 out of 100 patients with LH damage); Binder, Marshall, Lazar *et al* 1992; Kleinman, Sepkuty, Hillis *et al* 2007; Farne, Buxbaum, Ferraro *et al* 2004; Becker & Karnath 2007; and Bowen, McKenna & Tallis 1999. In right hemisphere-damaged patients, estimates of neglect range from 48% (Buxbaum, Ferraro, Veramonti *et al* 2004) to 82% (Stone, Halligan, Greenwood *et al* 1993), and approaching 100% where more sensitive measures are applied: Mario Bonato and colleagues ‘detected severe awareness deficits’ in right hemisphere-damaged patients, where the usual cancellation tests failed to reveal one (Bonato, Priftis, Umiltà *et al* 2013). Although Stone and colleagues (*vid sup*) found up to 65% of *left* hemisphere-damaged patients to display some form of neglect immediately after the stroke, a subsequent review concluded that ‘only right hemisphere lesions cause severe and persistent deficits’ (Corbetta & Shulman 2011). For an unusual case report of right hemineglect, see Peru, Leder & Aglioti 2000: the first (cortical) stroke in the left occipital lobe did not induce neglect; a second, left capsulo-thalamic (subcortical) stroke, however, did.

33 Cheung, Chen, Chen *et al* 2002.

34 For discussion of its (de)merits, see McGilchrist 2009b (110). Benjamin Lee Whorf, described by Geoffrey Pullum, Professor of Linguistics at Edinburgh University, as ‘Connecticut fire prevention inspector and weekend language-fancier’, was responsible for starting what Pullum, in a highly entertaining account of its history, calls the ‘great Eskimo vocabulary hoax’, which started by claiming (wrongly, according to Pullum) that Eskimos have seven words for snow, a tally which escalated to 100 in its continuous retelling over the next 50 years (Pullum 1989). Roberson & Davidoff argue for a modified version of the Sapir-Whorf hypothesis, namely that language *influences*, rather than determines, our perception (Roberson & Davidoff 2000; see also Kay & Kempton 1984). Some have argued against even that modified version (Heider 1972; Franklin,

Clifford, Williamson *et al* 2005). An interesting sidelight on the issue is offered by Lindsey & Brown 2002.

35 Gilbert, Regier, Kay *et al* 2006.

36 Kerkhoff 1999 (103). I first found this referred to in a paper by Becchio & Bertone (2005), but their rendering of the German original into English was somewhat impressionistic, so I have attempted a more faithful version.

37 Halligan & Marshall 1998, as cited in Becchio & Bertone 2005.

38 This right hemisphere faculty is already present in chicks (Corballis, Fendrich, Shapley *et al* 1999).

39 ‘Case II’, from Zingerle 1913a (22–4: emphasis in the original): » *Die Stimmung war öfters reizbar, ungeduldig, im allgemeinen aber heiter, zum Witzeln geneigt. Dies stand in Übereinstimmung damit, daß er merkwürdigerweise niemals von seiner Lähmung sprach, diese gar nicht beachtete, und auch gar kein Unbehagen wegen seiner Unbehilflichkeit äußerte. Er hatte für seine linke Körperseite keine Aufmerksamkeit, vermißte dieselbe auffälligerweise gar nicht und schien sie überhaupt vergessen zu haben. Selbst wenn er auf dieselbe aufmerksam gemacht wurde, betrachtete er z. B. den Arm wohl momentan, beschäftigte sich aber nicht weiter damit und fing sofort von etwas anderem zu reden an. Er wußte auch sicher, daß jeder Mensch eine linke und rechte Seite habe, wendete dies aber nicht für sich an ... versagte er plötzlich, und es zeigte sich weitgehende Ratlosigkeit, wenn man von seiner linken Körperseite zu sprechen anfang, darüber eine Auskunft verlangte. Er wurde verlegen, gebrauchte Ausflüchte, verstummte, wurde unaufmerksam, und es war auch erfolglos, ihm die früheren Erinnerungen an die linke Seite zu wecken. Dasselbe wiederholte sich, wenn ihm der Arzt an seinem eigenen Körper die linke Seite demonstrierte. Er kannte dieselbe: dieses Wissen war aber für seine Person ganz belanglos und in keiner Weise klärend. Drang man energischer in ihn, suchte man den Widerspruch zwischen seiner Fremdempfindung und der Wirklichkeit durch Belehrung, Hinlenkung der Augen ihm deutlich zu machen, wurde er immer unruhiger, und ein Verständnisseinerseits war ganz ausgeschlossen, eine Verständigung unmöglich. Es fiel ihm das Ungewöhnliche und Sinnlose gar nicht auf, daß er nur eine rechte Hälfte haben sollte ... Der Pat. hat nicht nur die Empfindung seiner linken Körperseite verloren und weiß von seiner Lähmung nichts, er hat auch ... die Erinnerung an seine linke Körperseite eingebüßt, es ist ihm also neben der Empfindung auch das frühere Wissen an seine linke Seite abhanden gekommen ... seinem Bewußtsein beschränkte sich die Vorstellung des Körpers anscheinend auf die rechte Hälfte, ohne Erinnerung dafür, daß dies früher anders war «.*

40 ‘Case III’ from Zingerle 1913b (31–2: emphasis in original): » *Der Pat[ient] zeigte ein Gebaren, das allen, die bei der Untersuchung anwesend waren, in hohem Grade auffiel. Während er, wie schon erwähnt, dem Gespräche trotz seiner Erkrankung mit angespannter Aufmerksamkeit folgte ... trat eine sofortige Änderung ein, wenn man vom Pat. etwas mit seiner linken Körperseite verlangte oder auch nur von derselben sprach. Ganz unvermittelt bot der Kranke dabei das Bild der schwersten Stumpfheit. Er sah ohne Zeichen einer aktiven Aufmerksamkeit vor sich hin, reagierte in keiner Weise, als ob er nicht hörte, oder nicht verstünde, was man wolle ... Der Kranke, der auch rasch über seine sonstigen Empfindungen Aufschluß gehen konnte, war auch nicht mit einem Worte zu bewegen, sich über seine linke Seite zu äußern, oder seine Empfindungen zu schildern. Auch dringendes, durch Schütteln unterstütztes Fragen scheiterte an der vollkommenen Ablehnung des Kranken. Es war einfach aus dem momentan gerade noch gesprächigen und aufmerksamen Pat. nichts herauszubringen ... Während er in Bezug auf seine rechte Körperseite sich wie ein ganz Normaler benahm, über dieselbe entsprechend verfügte und alle auf dieselben bezüglichen Reize und Fragen entsprechend verarbeitete, schien die linke Körperseite für ihn nicht zu existieren... «.*

[46](#) Kagerer, Wittmann, Szélag *et al* 2002. The literature on the appreciation of short sound intervals is evenly divided between those that show a right hemisphere- and those that show a left hemisphere-superiority, according to the survey by Brancucci and colleagues (Brancucci, D'Anselmo, Martello *et al* 2008). However, there is a fairly consistent tendency to show that the left hemisphere is superior for very short sounds (whether in speech or music), such as help discriminate consonants (Johnsrude, Zatorre, Milner *et al* 1997; Molfese 1984; Poeppel 2003).

[47](#) Danckert, Ferber, Pun *et al* 2007: 'these findings suggest a pivotal role for a right hemisphere frontoparietal network in the accurate perception of multi-second durations.' See also Merrifield, Hurwitz & Danckert 2010; Allman, Teki, Griffiths *et al* 2014.

[56](#) Cutting 2011 (174). *Zeitstillstand*, whereby time 'stands still' or ceases to exist, is encountered principally in schizophrenia (*ibid*, 25).

[57](#) Ovsiew 2014.

[58](#) Cummings 1997 (27). See also Bender, Feldman & Sobin 1968; Cummings, Syndulko, Goldberg *et al* 1982; Meadows & Munro 1977; Michel & Troost 1980; Stagno & Gates 1991. One interesting case involved a patient with partial situs inversus, a condition in which right and left sides of the body are reversed (eg, the apex of the heart is on the right, not the left, a sign known as dextrocardia). This man had palinopsia following an abscess in the *left* occipital lobe (Lunardi, Tacconi, Missori *et al* 1991). Situs inversus is often accompanied by reversed Yakovlevian torque (Schuler, Kasprian, Schwartz *et al* 2017); and sometimes by right hemisphere speech (Cohen, Geny, Hermine *et al* 1993; Ihara, Hirata, Fujimaki *et al* 2010). But see also Kennedy, O'Craven, Ticho *et al* 1999.

[61](#) Right hemisphere damage only: right parietal: Sakurai, Kurita, Takeda *et al* 2013; right temporoparietal: Otsuka-Hirota, Yamamoto, Miyashita *et al* 2014; right insular: Griffiths, Rees, Witton *et al* 1997: 'this deficit is analogous to the visual phenomenon of akinetopsia'. Bilateral: posterior cortical: Pelak & Hoyt 2005; temporo-occipital: Hess, Baker & Zihl 1989. The case of 'Bilaterale Affektion beider Okzipitallappen' (the case report has no title as such) demonstrated by Otto Pötzl & Emil Redlich in the *Wiener Klinische Wochenschrift* (1911) is often referred to in this context, but motion-blindness was a tiny part of the many problems the patient presented, and is

mentioned only in passing: ‘If in a darkened room one shows her a strong light-source in slower or faster motion, she seems not to perceive the motion of the object; she describes what she sees as “several lights”’ – » *Lässt man im Dunkelzimmer eine starke Lichtquelle in langsamerer oder schneller Bewegung auf sie wirken, scheint sie die Bewegung des Objekts nicht zu apperzipieren; sie bezeichnet das, was sie sieht, als ‚mehrere Lichter‘* « (518). Given that she had difficulty seeing objects at all, unless they were brightly lit and in strong bright colours, and she had gross problems of attention, as well as orientation in space to acoustic and visual stimuli (as well as word-finding problems), and since also little is known of the exact location of her brain lesions, this case is not in my view a reliable source of information about motion perception. Max Wertheimer, however, attended the same patient and examined and confirmed her difficulty in motion perception (Wertheimer 1912, 246–7, n7).

It has been suggested that the novelist Henry James, who in his last illness sustained a right hemisphere stroke, experienced reduplicative paramnesia (Bartolomeo 2013). But this is not clear. Rather he appeared disoriented, a much more common sequela of any cerebral disturbance: 'He said he was in California or in Cork and complained of being told he was actually in London. He expressed the desire to go to his mansion in Rye; afterwards, he believed he was there and commented upon how comfortable and pleasant the place was. In his words, "This place I find myself is the strangest mixture of Edinburgh and Dublin and New York and some other place that I don't know"'. On the other hand, there is evidence that disorientation for place is commoner after right hemisphere damage (Fisher 1982). And he believed he was Napoleon. It would not have pleased James to know that this is (or was) a rather common delusion; but in an engaging and entirely characteristic interpretation of the imperial role, he dictated directions for the redecoration of the Louvre and the Tuileries (Edel 1968).

158 Laeng, Shah & Kosslyn 1999.

159 Price & Friston 2002b (437): ‘Living things (irrespective of task) increased activation in the right middle frontal and right fusiform gyri. Non-living things (irrespective of task) increased activation in the same left posterior middle temporal area seen for tools and inanimate objects by Martin *et al* 1996 [Martin, Wiggs, Ungerleider *et al* 1996], Damasio *et al* 1996 [Damasio, Grabowski, Tranel *et al* 1996], Mummery *et al* 1996 [Mummery, Patterson, Hodges *et al* 1996] and Mummery *et al* 1998 [Mummery, Patterson, Hodges *et al* 1998].’ The authors are commenting on the findings of Cappa, Perani, Schnur *et al* 1998. See also Damasio, Tranel, Grabowski *et al* 2004; and Capitani, Laiacona, Mahon *et al* 2003. One study (Cousin, Peyrin & Baciú 2006), based entirely on linguistic terms, found that ‘living’ was more left-lateralised than ‘edible’, a finding that they claim ‘is in agreement with those provided by other studies using categorization tasks’, citing six papers. Not one of those papers supports this finding: only one even refers to the living/non-living distinction, having nothing whatever to say about differential lateralisation of living versus non-living stimuli.

160 Mormann, Dubois, Kornblith *et al* 2011. What is more, animal images that elicited neuronal responses in the amygdala contained both aversive and cute animals, and there was ‘no relationship between amygdala responses and either the valence or arousal of the animal stimuli’, the implication being that it is animacy *per se*, not an emotional response to an animal, that underlies the distinction.

164 See, eg, Dixon, Piskopos & Schweizer 2000; Gale, Done & Frank 2001; Warrington & Shallice 1984; Gainotti 1996; Basso, Capitani & Laiacina 1988; Masullo, Piccininni, Quaranta *et al* 2012. The last study, while confirming the usual findings that musical instruments sort with the living, and that body parts do not, oddly chooses to conclude, not that this tells one something about body parts and musical instruments, but that it invalidates the distinction between inanimate and animate.

55 Bushdid, Magnasco, Vosshall *et al* 2014.

56 Ohloff 1994; Ellena 2012 (entry for 22 July 2010).

57 Right hemisphere predominantly involved in odour recognition: Kobayashi 2006; Small & Prescott 2005; Cerf-Ducastel & Murphy 2001; Royet & Plailly 2004; Hudry, Ryvlin, Saive *et al* 2014; Zucco & Tressoldi 1989; Zatorre & Jones-Gotman 1990; Zatorre, Jones-Gotman, Evans *et al* 1992; Zald & Pardo 1997; Dijksterhuis, Møller, Bredie *et al* 2002; Kurth, Zilles, Fox *et al* 2010. One study, which measured odour naming as well as differentiation, found equal right and left hemisphere activations: Qureshy, Kawashima, Imran *et al* 2000. In gustation: Kurth, Zilles, Fox *et al* 2010; Small, Jones-Gotman, Zatorre *et al* 1997; Singh, Iannilli & Hummel 2011; Lötsch, Reither, Bogdanov *et al* 2015; Lötsch, Ultsch, Eckhardt *et al* 2016; though two studies suggest no lateral difference: Kinomura, Kawashima, Yamada *et al* 1994; and Veldhuizen, Albrecht, Zelano *et al* 2011.

58 Left hemisphere predominantly involved in emotional reaction to odours: Plailly, Bensafi, Pachot-Clouard *et al* 2005; Broman, Olsson & Nordin 2001; Hudry, Ryvlin, Saive *et al* 2014. Or, since this applies mainly to repugnant odours – the right hemisphere being associated with reactions to pleasant odours – may be to do with the tendency for disgust to lateralise to the left hemisphere.

59 Pazart, Comte, Magnin *et al* 2014; Brand & Brisson 2012. However, this suggestively parallels a situation in music. Here the appreciation of music is almost entirely right hemisphere-dependent – all aspects of melody and harmony are critically dependent on the right hemisphere, though the left hemisphere can process simple rhythm (if there are complex rhythm patterns or cross rhythms and syncopations, the right hemisphere is once again predominant). Nonetheless, professional musicians, perhaps like sommeliers, are more dependent on the left hemisphere than amateurs. In the case of musicians there are various possible explanations: (a) professional musicians may take a more analytic approach; (b) they are trained to read music (a serial process much like reading sentences, which is known to be heavily left hemisphere-dependent); (c) they are trained to co-ordinate both hands, and therefore hemispheres, in almost every musical activity; and (d) they are much more familiar with the pieces that they perform than any amateur (since familiarity – as opposed to simple recognition – tends to activate categorisation processes in the left hemisphere). If the findings on olfaction are a parallel phenomenon, they cannot depend on the first three, and must depend on the fourth, familiarity: amateurs are encountering newness, where experts are categorising familiarities. In *The Master and his Emissary*, I argued that this was the most likely explanation in relation to music, too, since the contrapuntal music of JS Bach appears to be an exception to the rule that professional musicians rely more on the left hemisphere. In dealing with fugal material they still rely almost entirely on the right hemisphere – which also cannot be explained by the first three hypotheses, but does make sense in terms of the last, since the music of Bach, almost alone, is impossible to attend to in its entirety (as the researchers themselves hypothesised, a range of melodic contours needs to be maintained in awareness simultaneously), and is therefore effectively new on every encounter. For details, see McGilchrist 2009b, 72–7.

122 Horrax 1923. In a report of two cases of a central scotoma (an area of diminished vision), one had right-sided, the other left-sided, pathology (Brust & Behrens 1977).

123 Trojano, Conson, Salzano *et al* 2009; Imai, Nohira, Miyata *et al* 1995; Shiga, Makino, Ueda *et al* 1996; Nijboer, Ruis, van der Worp *et al* 2008. Interestingly, the four cases also showed metamorphopsia for objects or body parts, typically processed by the left hemisphere. The case reported by Satoh and colleagues is sometimes included here, though it involved not left hemisphere hypoperfusion, but hyperperfusion, so that interpretation is more difficult: there was a marked increase in blood flow in the left occipital pole while the patient experienced the visual distortions, and a marked decrease in blood flow after the symptoms disappeared (Satoh, Suzuki, Miyamura *et al* 1997).

128 For a survey, see the fascinating review of 757 patients by Gross and Huber, one of the most acutely observed to date (1972). The most interesting series in English is that of Chapman (1966). Alterations in size, distance, constancy, shape, brightness, and motion perception were the commonest described by Chapman in schizophrenia: all of these depend primarily on the right hemisphere (Chapman *op cit*, esp 230). See also Waters, Collerton, ffytche *et al* 2014.

129 Gross *et al*, *op cit* (125): » *Ich sah einen Mann, der plötzlich Zähne und eine Schnauze wie ein Kaninchen hatte* «.

- 161** Macropsia and micropsia, at least, may not be uncommon in the general population: a survey of Japanese schoolchildren found a prevalence of 6–8% (Abe, Oda, Araki *et al* 1989).
- 162** Lippman 1952. Lippman describes seven patients, some of whom had strikingly Alice-like symptoms, and explicitly makes the connexion with Dodgson. Podoll & Robinson (1999) refer to a drawing of a figure with parts of the face and hand missing in such a way as to suggest that Dodgson had a rounded paracentral negative scotoma such as may be experienced in migraine; in fact the eminent ophthalmologist William Bowman had diagnosed such a scotoma in Dodgson's case in 1856. Dodgson also referred in an 1885 entry in his diary to having 'experienced, for the second time, that odd optical affection of seeing moving fortifications, followed by a head-ache', a clear description of migraine. Although this suggests this was only his second attack, there is good reason to believe he may have suffered migraine attacks accompanied by aura, but without headache – a common enough phenomenon – for many years. Possibly in favour of a diagnosis of temporal lobe epilepsy, Dodgson reported in his diary that he 'had an attack ("epileptiform" Dr Morshead called it) which left me with a sort of headache and not feeling my usual self for a week or ten days' (entry for 20 January 1886). Apparently two other physicians also thought he suffered from temporal lobe epilepsy (TLE). In the clinical setting, without the possibility of EEG studies, the differential between migraine and TLE can be difficult to make, and the conditions are thought by some to be related (see, eg, De Simone, Ranieri, Marano *et al* 2007). See also, in favour of a diagnosis of TLE: LaPlante 1993 (esp 70–2). A balanced view is probably that of neurologist Yvonne Hart, that Dodgson very likely had migraine and possibly had epilepsy (Hart 2010).
- 163** Coleman 1933 (48).
- 164** Lippman 1952.
- 165** One had right-sided headaches, and the visual field of the distortion in the last case referred to just now was to the right, which on the face of it suggests left-sided pathology. However, the situation is complicated, since, as we have seen, right-sided pathology gives rise to effects in both the

left *and* right visual fields. The upshot: it is reasonable to assume that effects in the left visual field are due to right-sided pathology, but it is not safe to assume that effects in the right visual field are due to left-sided pathology.

166 Todd 1955 (emphasis added).

167 In one case a woman displayed hypoperfusion in the right frontoparietal operculum (Morland, Wol, Dietemann *et al* 2013); in another case, symptoms were due to a right temporoparietal cavernoma (Philip, Kornitzer, Marks *et al* 2015); and, in a third, the only lateralised finding was a right frontal abnormality (Sasaki, Kamei & Chida 2002). In a fourth case, distortions were left visual, therefore likely to be due to a right-sided disturbance: ‘a perception of enlargement of the left side of the head, a length increase in left-side extremities, a slowing-down of overall movements, surrounding objects appearing to be far away/smaller’ (Uca & Kozak 2015). The addition of the slowing down effect in this case, which we have seen to be associated with right hemisphere disturbance, is particularly striking, and forms part of the Alice in Wonderland syndrome that is often neglected. Two cases involved right-sided frontal pathology (Weijers, Rietveld, Meijer *et al* 2013; Zwijnenburg, Wennink, Laman *et al* 2002). In another case, concerning a seven year-old girl with metamorphopsia (‘the objects and the people around her seemed bigger or smaller than they were’), it was possible to study her brain perfusion using single photon emission computed tomography (or SPECT), a particularly informative investigation: it showed right frontoparietal hypoperfusion (Gencoglu, Alehan, Erol *et al* 2005). In 2010 Brumm and colleagues carried out a review of the nine SPECT studies in AiWS to date (Brumm, Walenski, Haist *et al* 2010), which included the case of Gencoglu *et al*. In one case findings were normal, but of the remaining seven (so far undiscussed) cases each one showed hypoperfusion in the right parietal or right occipital region, two of them additionally demonstrating hypoperfusion in the left occipital region. The authors comment that ‘hypoperfusion in the right parietal cortex was reported for five cases, whereas left parietal hypoperfusion was not found in any of the nine cases’. They also reported a further case of their own, which involved episodes of micropsia in a child: scans revealed both right and left hypoactivation of the posterior cortex during attacks. In their case study, during one task, an active viewing task, hyperactivation of the right parietal cortex was noted, a possibly discordant finding. The authors comment: ‘this right hemisphere parietal bias is perhaps not a surprising result from this active task, as many studies have implicated the right hemisphere in a variety of spatial attention tasks.’ This could be special pleading, though it is true that hyperactivation can be as pathological as hypoactivation. Among their included cases are also those from a study by Kuo and colleagues, in which SPECT scans were conducted in four children. The criteria here were loose, but even by those standards only three can be said to have had AiWS: one saw eyes becoming larger or smaller, and ‘variant sizes of people’; another saw ‘distorted people’; a third saw the television picture upside down, while ‘windows and house seemed crooked’. In all three cases, the right posterior cortex was involved, though in two of those cases involvement was bilateral. The first case had hypoperfusion in all right hemisphere regions – frontal, temporal, parietal and occipital. The second had right frontoparietal hypoperfusion only; the third had right and left parieto-occipital hypoperfusion, as well as left frontal. All cases showed right parietal involvement, the area which has been most often implicated. (The fourth case is the one marked by alterations of colour cast and ‘scintillations’ only – Kuo, Chiu, Shen *et al* 1998). In a number of other reported cases, no imaging was conducted and no lateralising signs were reported (Tunç & Başbuğ 2017; Liaw & Shen 1991; Lahat, Berkovitch, Barr *et al* 1999).

169 Braun, Duval & Guimond 2005.

170 Lampl, Lorberboym, Gilad *et al* 2005.

171 For schizophrenia, see Chapter 9. For mania: ‘Mania is seen almost exclusively with damage to the right hemisphere’, according to Jeffrey Cummings in a review of neuropsychiatric manifestations of right hemisphere lesions, which agrees with the findings of an earlier review by Starkstein and Robinson (Cummings 1997; Starkstein & Robinson 1997). See also Starkstein, Berthier, Fedoroff *et al* 1990; Starkstein, Fedoroff, Berthier *et al* 1991; Starkstein, Robinson, Honig *et al* 1989; Cummings & Mendez 1984; Braun, Daigneault, Gaudet *et al* 2008; Starkstein, Boston & Robinson 1988. Elation and irritability characterise the left hemisphere: they become unchecked when there is right-sided, particularly right frontal, damage. Overdrive in the left frontal region, whether this takes the form of left hemisphere hypermetabolism (Dunayevich & Keck 2000) or left focal paroxysmal brain excitation, due to epilepsy, is common in mania (Parnas & Korsgaard 1982; Wells 1975).

173 Hugdahl, Løberg, Jørgensen *et al* 2008.

174 Sritharan, Line, Sergejew *et al* 2005.

175 Aleman, Sommer & Kahn 2007. Nonetheless, a single case study of a female patient with both visual and auditory hallucinations who used unilateral nostril breathing, assumed in the study to stimulate the contralateral hemisphere, found that right nostril breathing appeared to be associated with fewer hallucinations (Shannahoff-Khalsa & Golshan 2015). However, she had a diagnosis of both narcissistic and borderline personality disorder as well as of a psychotic disorder; she was already heavily medicated with antipsychotic medication (clozapine) that has a relative suppressive effect on left hemisphere function; females do not show clear lateralising results when compared with males; and it is a matter of dispute whether the hemispheric stimulation is contralateral or ipsilateral (Block, Arnott, Quigley *et al* 1989). According to Bhavanani, Ramanathan, Balaji *et al* 2014, right nostril breathing caused sympathomimetic effects, known to be associated with increased right hemisphere function, and left nostril breathing produced parasympathomimetic effects, known to be associated with left hemisphere function. As a result of all this, probably no sound conclusions can be drawn from the single case described by Shannahoff-Khalsa *et al*, *op cit*.

176 Bremer 1996. The French psychiatrist Jules Séglas described a patient with persecutory hallucinations principally in the right ear: « *Les hallucinations de l’ouïe continuent toujours, presque incessantes, et surtout dans l’oreille droite ... Ces voix, le plus souvent désagréables, ne lui disent plus de sottises, mais des nuances, des ordres brefs et même quelques phrases* » (Séglas 1890, 12). However, Valentin Magnan (1883) reported that four patients with a chronic psychotic illness involving auditory hallucinations experienced unpleasant, critical and hostile remarks in their left ear, and soothing, even flattering remarks in their right ear.

189 McGilchrist & Cutting 1995.

190 Serafetinides 1965. In this study the majority of the subjects, whether the focus was left- or right-sided, had gross pathology – sclerosis or tumour – underlying the focus, which makes it clearer than ever that we are dealing with the dysfunction of an affected hemisphere as a whole. A study in cats showed predominantly excitations in the left hemisphere after administration of hallucinogenic drugs, including ketamine and phencyclidine (Contreras, Dorantes, Mexicano *et al* 1986). A recent study in humans shows greater reductions in brain activation in the right hemisphere than the left, particularly in the frontal and temporal region, after administration of LSD, though impairment of the left frontal region plays a part (Schmidt, Müller, Lenz *et al* 2018); in another study, however, the same team found that connectivity between the thalamus and the right fusiform gyrus and insula was related to auditory and visual ‘drug effects’ (Müller, Lenz, Dolder *et al* 2017). A study of mescaline found that it ‘induced a decrease in functioning of the right hemisphere’ (Hermle, Gouzoulis-Mayfrank & Spitzer 1998). A single dose of ayahuasca in depression increased perfusion in the left nucleus accumbens, left subgenual area and right insula (Sanches, de Lima Osório, Dos Santos *et al* 2016).

4. JUDGMENT

1 Merleau-Ponty 1945 (52): « *La perception est un jugement, mais qui ignore ses raisons, ce qui revient à dire que l'objet perçu se donne comme tout et comme unité avant que nous en ayons saisi la loi intelligible* ».

2 Since there is a wealth of evidence that depression is in most cases due to unopposed action of the right frontal pole (usually because of underactivity in the left frontal pole or underactivity of the right posterior cortex – see McGilchrist 2009b (63–4) for detailed discussion), it would not be surprising if delusions of guilt and of poverty, which sometimes accompany severe depression, were due to hyper- rather than hypo- activity of the right hemisphere. However, I am not aware of any evidence that this is the case; and there is some evidence that when depression becomes delusional, there is also important right-sided dysfunction (Skaf, Yamada, Garrido *et al* 2002). Cotard's delusion is thought to be a depressive delusion, but is clearly associated with right parietal *deficits* (see below).

3 Young 2000.

4 Stangeland, Orgeta & Bell 2018. Cases not included which appear to meet criteria: Peroutka, Sohmer, Kumar *et al* 1982 (one case); Berthier & Starkstein 1987 (one case). One case (out of three reported) in another paper – Mesulam, Waxman, Geschwind *et al* 1976 – might have met criteria.

16 Trimble (1991) concludes that about three out of four cases of *de novo* psychosis following temporal lobectomy do so after right temporal lobectomy. A review by Matsuura (1997) confirmed this, finding 24 out of 32 cases of *de novo* post-lobectomy psychosis follow right temporal lobectomy; Mace & Trimble (1991) find 6/6 cases in their series; Manchanda, Miller & Mclachlan (1993) find 4/4 in their series; Shaw, Mellers, Henderson and colleagues (2004) find 7/11 in their series; Leinonen, Tuunainen & Lepola (1994) report 2/3 of their cases. Together these reports yield 43/56 cases following right versus left temporal lobectomy, roughly 77%.

- [62](#) ‘Severe right hemispheric dysfunction’: Debruyne, Portzky, Van den Eynde *et al* 2009; right frontal: Coltheart 2007; Coltheart, Langdon & McKay 2007; right fronto-temporoparietal: Nishio & Mori 2012; right frontoparietal: Perez, Fuchs & Epstein 2014; three cases: two right temporal, one

right frontotemporal: Drake 1988; right temporal: Murai & Fukao 2003; AB Joseph 1986b; Joseph & O’Leary 1986 (suggests right temporal area of key significance in cases of atrophy associated with Cotard’s); right temporoparietal: Young, Robertson, Hellawell *et al* 1992; Gonçalves & Tosoni 2016; right parietal: Wolańczyk, Komender & Brzozowska 1997; right temporo-parieto-occipital: Parks, Rigby, Gubitz *et al* 2014. Charland-Verville and colleagues (Charland-Verville, Bruno, Bahri *et al* 2013) found various bilateral regions of hypoperfusion, but in addition just one lateralised area, the frequently implicated right temporoparietal junction. Young & Leafhead (1996) describe three cases, one right temporoparietal, the others without identifiable focal lesions. However, the other two exhibited, in addition to Cotard’s syndrome, Capgras syndrome, which is known to be right hemisphere-dependent, and all three exhibited prosopagnosia, a strongly right-lateralising sign, with *all three* producing scores on face recognition even lower than the mean for subjects with right brain damage, leading the authors to presume a connexion between right hemisphere dysfunction and Cotard’s. Petracca and colleagues (Petracca, Migliorelli, Vázquez *et al* 1995) made no observations about lateralisation. Two further cases are described by Gardner-Thorpe & Pearn (2004): one had multiple sclerosis and no focal lesion could be identified. The other case is complex: the subject, who had Marfan’s syndrome, had a previous left parietal lesion, which had given rise to transient amnesia and nominal aphasia, which quickly resolved. Three years later, however, he presented with Cotard’s syndrome: on this occasion he had a left visual field defect and MRI showed, amongst other things, a ‘cryptic vascular malformation high in the medial part of the right parietal lobe’, the area implicated in most other cases of localised lesions giving rise to Cotard’s syndrome. See also reviews by Debruyne, Portzky, Van den Eynde *et al* 2009; Debruyne, Portzky, Peremans *et al* 2011; Malloy & Richardson 1994; and Kudlur, George & Jaimon 2007, all of which suggest right hemisphere dysfunction as the critical brain correlate. In a search of the Mayo clinic’s database, in cases where local intracerebral pathology had been identified, it always involved the right hemisphere (or both), never the left hemisphere alone: Sahoo & Josephs 2018. Additionally, there is the common overlap between Cotard’s and Capgras’ syndromes to take into account, as well as overlaps with prosopagnosia, paranoia, derealisation and dysmetropsia, all of which are associated individually with right- rather than left -hemisphere damage. Finally, in Cotard’s paper of 1880, there are no mentions of laterality; in his paper of 1882, however, he offers a series of observations of 11 patients, only one having signs of lateralisation, namely, a left hemiplegia. However, there exist two known cases of Cotard’s syndrome with primary left hemisphere pathology: one definite, though in a child (Bhatia 1993: left parietal), and one possible, in that the subject had no belief that he was dead (Caliyurt, Vardar & Tuglu 2004: left frontotemporoparietal). Oddly, given that, at least in one case, the authors recognise the unusual lateralisation, there is no record of handedness in either case.

78 McGilchrist, Jadresic, Goldstein *et al* 1993. At one month following his stroke, by which time the syndrome was clinically well established, the only finding was a right-sided infarct. A follow up scan at seven months revealed bilateral thalamic infarcts at that stage.

79 Regard & Landis 1997.

80 Eg, Anzellotti, Onofri, Maruotti *et al* 2011: ‘these experimental data suggest that out of body experiences are associated with damage to the right temporoparietal junction ... whereas autoscopic hallucination is associated with damage to the right parieto-occipital cortex’. See also Blanke, Ortigue, Landis *et al* 2002; Blanke & Mohr 2005; Blanke & Arzy 2005; and Heydrich, Lopez, Seeck *et al* 2011. Heydrich has a series of 9 cases, eight of which had disturbances of the right temporoparietal region: Ionta, Heydrich, Lenggenhager *et al* 2011; Heydrich & Blanke 2013. However in one study there was no clear lateralisation across 10 cases (Devinsky, Feldmann, Burrowes *et al* 1989).

81 Brugger, Blanke, Regard *et al* 2006. But the area is confused. Cases of heautoscopy are described after right hemisphere pathology: a case following a right parieto-occipital lesion is reported by Kölmel (1985). Equally it is arguable that two, if not all three, of the cases of ‘autoscopy’ described by Lunn, each with right hemisphere pathology, are not classic autoscopy and are heautoscopic in character (Lunn 1970, originally reported in Lunn 1948). On the other hand, Heydrich & Blanke (2013), make a case that heautoscopy is indeed associated with mainly left-sided, and autoscopy with right-sided, brain dysfunction. Similarly, Brugger and colleagues in their review of cases of ‘felt presence’ found that, in the 12 cases where there was a unilateral brain lesion, eight were in the left hemisphere and four in the right hemisphere. Of the total 31 cases, in 19 (61%) the ‘presence’ was lateralised to the right side of the body (Brugger, Regard & Landis 1996). Ultimately, Brugger and colleagues argue, in my view correctly, that the field is bedevilled by definitional problems, and that a new system of classification needs to be adopted (Brugger, Regard & Landis 1997).

95 Bisiach 1997, 237–53.

96 Macdonald Critchley first described the condition: ‘perhaps it is more frequently found in patients with a left hemiplegia than with a right’ (1974). In the paper he describes five cases: four are described as ‘right hemisphere’, one as right temporoparietal. Kaplan-Solms & Solms 2000 (187–8) describe two cases: one right frontotemporoparietal, the other right temporoparietal. The case reported by van Stralen, van Zandvoort & Dijkerman (2011) is right frontoparietal; that of Moss & Turnbull (1996) is right temporoparietal; others are similar (Loetscher, Regard & Brugger 2006). Delgado & Bogousslavsky (2018) state that ‘the handful of cases of misoplegia described in the literature frequently presented a right hemispheric damage ... misoplegia is one of the ... self-awareness syndromes of the right hemisphere.’ Pearce (2007) finds that it is ‘most often the result of a right hemisphere lesion ... classically the inferior parietal lobule’. Two cases reported by Borah and colleagues of left limb self-mutilation exhibited right temporoparietal pathology (Borah, McConnell, Hughes *et al* 2016), and exhibit overlap with misoplegia: the authors speculate that right hemisphere damage may ‘release’ the left hemisphere, citing Shakya, Shyangwa, Pandey *et al* 2010, where left temporal seizures resulting in self-harm are reported. A condition of obsessive concern may represent a form of misoplegia, according to Kaplan-Solms & Solms (see above), and Bogousslavsky and colleagues, who report three right temporoparietal cases (Bogousslavsky, Kumral, Regli *et al* 1995), though the phenomena are somewhat diverse in nature. The latter authors make the point that not one of 13 patients with a ‘mirror’ infarct in the left hemisphere showed similar symptoms. However, Cutting found in his series of patients five cases relating to a right-sided limb and only two to a left-sided limb (Cutting 1978). The situation is made more complex by the fact that, as he acknowledges, depressive symptoms, which may mimic misoplegia, are commoner after left hemisphere stroke, leading to a potential overestimate; conversely many cases of left hemisphere stroke will be aphasic, leading to a potential underestimate. Bisiach describes patients taking a dislike for objects in the left visual field, and calls this ‘levophobia’: he considers misoplegia may be a subset of this (Bisiach 1997, 249). As Cutting astutely notes, whereas after a right hemisphere stroke, a limb is transformed into some alien, bizarre object, after a left hemisphere stroke (since the emotional depth of the right hemisphere is still available to the sufferer) the limb is more often merely absent and the area somehow replaced by grief or pain: there is an increase in emotion, and a decrease in ‘thingness’. However, this is in my view quite distinct from misoplegia. Consider these cases, all taken from Hécaen & de Ajuriaguerra 1952 (177, 179 & 186): (a) shrapnel wound to left frontoparietal region: ‘my right side is replaced by pain ... The half corresponding to the world is abolished’ – « *mon côté est remplacé par de la douleur ... la moitié correspondante du monde s’abolit* »; (b) left parietal angioma: patient reports ‘pain in the right hand ... the patient suddenly feels that he has no right hand ... he has a sense of oppression’ – « *douleurs de la main ... le malade a soudain l’impression qu’il n’a plus de main droite ... il a une sensation d’oppression* »; (c) left ‘centro-occipital’ epileptogenic focus: ‘as if there was a void, something vague on the right, it seems that on this side everything is distant, empty – « *comme s’il y avait du vide, du vague à droite, il me semble qu’à côté de moi tout est loin, vide* ».

97 Loetscher, Regard & Brugger 2006.

98 Borah, McConnell, Hughes and colleagues (2016) report a case of self-amputation related to right temporoparietal damage. On the preponderantly right hemisphere nature of the underlying pathology, see Hilti, Hänggi, Vitacco *et al* 2013; Hilti & Brugger 2010; Brang, McGeoch & Ramachandran 2008; McGeoch, Brang & Song 2011; and Blanke, Morgenthaler, Brugger *et al* 2009.

139 ‘False memory syndrome’ involves memories of a traumatic experience, most frequently childhood sexual abuse, which are objectively false, but in which the person strongly believes. They are often associated with suggestion during certain kinds of therapy, and some may be factitious: the area is controversial. They have similarities with confabulation, which, as we have seen, is strongly related to right hemisphere impairment. Mendez & Fras (2011) hypothesise that ‘similar to confabulations, there is probable attenuation of a right VMPFC [right ventromedial prefrontal cortex] doubt tag’.

149 Bergert (2013) reports that in the relatively unusual cases where this is achieved by the left hemisphere, it appears to be a consequence of a decreased number of recognitions altogether – whether correct or incorrect. If you largely fail to recognise, you are bound to have a low rate of false recognition.

150 McGeorge, Beschin, Colnaghi *et al* 2007. Some researchers propose that this is because of the failure of the left hemisphere to make subtle discriminations, and to lump similar items together (De Renzi & Spinnler 1966; De Renzi, Faglioni & Villa 1977); others that it might be because the left hemisphere depends more on familiarity and the degree to which items could easily be coded in words (Kimura 1963a; Milner 1971).

151 Metcalfe, Funnell & Gazzaniga 1995; Phelps & Gazzaniga 1992. A study of evoked potentials in the brain (electrical activity in response to a stimulus) suggests that discrimination between false and true recognition may produce activity that is lateralised to the right hemisphere (Fabiani, Stadler & Wessels 2000).

158 Bellamy & Shillcock 2007; Ito 2001; Buratto, Zimmermann, Ferré *et al* 2014. The situation may be clarified by making a distinction not always made between right frontal and right temporal cortex. For the right hemisphere has its own internal control system, though it also acts as a brake on the left hemisphere. Much depends on whether the right frontal cortex is intact or not. For instance, a study of 17 patients with right temporal lobe damage showed that they could not recall faces seen (since that requires intact right temporal function), but at least didn't score false positives; whereas those with right frontal lobe damage showed the reverse pattern – faces could be recalled, because the right temporal cortex was functioning, but there were false positives, because the cautionary evaluation of the right frontal cortex was not. It is failure of frontal inhibitory control that leads to false beliefs and perceptions (Mendez 2006). This may also be why the right frontal lobe was activated whenever there was a false recognition in either right or left hemisphere: to make the mistake of interpreting the monitor coming into action as a *cause* would be like interpreting the activation of a sprinkler as the *cause* of a house-fire. The right frontal lobe is the monitor that is activated by any kind of discrepancy in a range of tasks.

159 Buratto, Zimmermann, Ferré *et al* 2014.

- 315** Goel 2007. Nonetheless the left hemisphere can overcome bias when it is dealing with arbitrary material that has no real world counterpart. Houdé, Zago, Mellet *et al* (2000) trained participants to find falsifying cases of a complex conditional rule with a negative antecedent, such as: ‘if there is not a blue triangle then there is a red circle’. The training involved teaching subjects to overcome the perceptual matching bias inherent in the task. Thus, as the authors say, ‘this task requires subjects to get beyond perceptual “traps” and know how to falsify conditionals’. They found a shift in neural activity from bilateral posterior regions in the ‘perceptual’ condition to a left frontal network after

training on the conditional falsification task (see also Houdé, Zago, Crivello *et al* 2001; and Houdé & Tzourio-Mazoyer 2003).

5. APPREHENSION

1 *Tao Te Ching*, §64 (trans S Mitchell).

2 Rothschild 1930 (466: emphasis in original): » ... [eine] Verschiedenheit, die ein Ausdruck der allerursprünglichsten Lebensstatsache, des Gegenüber, der Zweiheit oder besser der Polarität von Individuum und Welt darstellt. Die linke Seite des Leibes dient mehr als Aufnahme- und Wirkungsstätte des Fremden, die rechte Seite mehr den aus der Individualität herauswachsenden aktiven Lebensäußerungen. Die Polarität von Individuum und Kosmos hat eine Entsprechung in der Polarität von rechts und links, das ist der Sinn, den wir in der Organisation des Leibes glauben sehen zu können «.

- 35** Semenza 1988; Guariglia, Piccardi, Puglisi Allegra *et al* 2002.
- 36** Engerth 1933. The case report referred to above (Guariglia *et al* 2002) is unique thus far, given the left hemisphere lesion: the subject's performances 'were particularly defective on tests relying on visuo-spatial body representation, but her semantic and linguistic knowledge about body and body parts were spared', which is the mirror inverse of the normal situation, and it would be hard to draw much in the way of reliable conclusions from it. For the record, she was right-handed.

7 Schlumpf, Reinders, Nijenhuis *et al* 2014.

8 Ohara, Nishii, Nakajima *et al* 2004.

9 Kas, Lavault, Habert *et al* 2014. Another patient in which the sense of reality was not the primary disturbance showed bilateral deficits (Landtblom, Dige, Schwerdt *et al* 2002).

10 ‘Focal unilateral limbic seizure activity in the depth’ interferes with the cognitive functions of the hemisphere involved, even when unnoticed clinically or undetectable on the surface EEG, provided that epileptiform EEG activity lasts for several seconds; and ‘this interference is specific to the “dominant” processing of the discharging hemisphere’ (Regard, Cook, Wieser *et al* 1994).

11 Koles, Lind & Flor-Henry 2004; Flor-Henry, Lind & Koles 2004; Gruzelier 1973; Gruzelier & Venables 1974. (NB in the case of both the Gruzelier studies here cited consideration should be given to the comments of Shimkunas (1978, 210–11), which suggest that Gruzelier may have partly misinterpreted his own findings.)

12 Maier, Mellers, Toone *et al* 2000; Flor-Henry 1969a; Flor-Henry 1969b; Gallhofer, Trimble, Frackowiak *et al* 1985. See Trimble 2007 for a fascinating overview of this area.

13 Mullan & Penfield 1959.

14 Devinsky, Putnam, Grafman *et al* 1989.

15 This is a case reported by Harvey Cushing (1922: ‘case 5’, 364–7). A case reported by Cushing’s colleague Gilbert Horrax would appear to refer to the same individual (Horrax 1923, 543).

16 This case is reported by Macdonald Critchley, who states the side to be unverified, although he thought it was most likely to be left-sided (1951). Cutting (2011) does report one other case, but the subject in that case had a right frontal tumour as well as a left parietal tumour (see Critchley *op cit*).

17 McKinnell 2017 (location 190, 222).

28 Hypomania and mania: ‘A review of reported cases reveals that most focal lesions associated with secondary mania involve the diencephalic region and that the majority of lateralized lesions are on the right side’ (Cummings & Mendez 1984). This has been borne out by many subsequent studies: Robinson, Boston, Starkstein *et al* 1988; Cutting 1990; Kulisevsky, Berthier & Pujol 1993; Cummings 1997; Vuilleumier, Ghika-Schmid, Bogousslavsky *et al* 1998; Braun, Larocque, Daigneault *et al* 1999; Blumberg, Stern, Martinez *et al* 2000; Carran, Kohler, O’Connor *et al* 2003; Dodson 2004; Braun, Daigneault, Gaudelet *et al* 2008; Belyi 1985. In one case a patient was scanned before and after a right hemisphere infarct: ‘comparison of pre- and poststroke SPECT scans demonstrated a unique pattern of left orbitofrontal hyperperfusion, with extensive right frontal hypoperfusion only after the stroke, during the manic episode’ (Mimura, Nakagome, Hirashima *et al* 2005, 263). Not all researchers are in agreement, however: see, eg, Bearden, Hoffman & Cannon 2001; and Caligiuri, Brown, Meloy *et al* 2004. A patient scanned during an episode of mania induced by deep brain stimulation showed clear activation of the right dorsolateral prefrontal and inferior temporal cortex, as well as of the left anterior cingulate cortex, and deactivation of the left insula (Ulla, Thobois, Lemaire *et al* 2006); and similar findings have been made in similar experimental conditions, with activations in the left thalamus, but also in the right middle and inferior temporal gyrus, right inferior parietal gyrus and right inferior frontal gyrus, and deactivation in the left posterior middle temporal and occipital gyrus, left middle frontal gyrus, bilateral cuneus and right medial prefrontal/anterior cingulate gyrus (Mallet, Schüpbach, N’Diaye *et al* 2007). Sadness: Asthana & Mandal 2001; Robinson & Price 1982; Schiffer, Zaidel, Bogen *et al* 1998. Sadness and empathy are highly correlated: this can be seen in studies of children and adolescents (see, eg, Rothbart, Ahadi & Hershey 1994). Children and adolescents with psychopathic tendencies have difficulty recognising sad faces (Blair & Coles 2000; Blair, Colledge, Murray *et al* 2001) and sad vocal tones (Stevens, Charman & Blair 2001). Reparative behaviour and sadness are highly correlated in childhood (Cole, Barrett & Zahn-Waxler 1992). There is also a direct correlation between sadness and empathy, on the one hand, and feelings of guilt, shame and responsibility, on the other (Zahn-Waxler & Robinson 1995). See also McGilchrist 2009b (63ff), for further discussion and references.

36 Nagy, Ákos, Biro *et al* 2010. For those who are wondering how this can work in an entirely symmetrical relationship, the authors suggest that ‘hierarchical organisation of group flight may be more efficient than an egalitarian one, at least for those flock sizes that permit regular pairwise

interactions among group members, during which leader-follower relationships are consistently manifested.'

123 Grüsser 1983. Out of 103 mother and child sculptures dating from the period between 1900 BC and 0 BC, 99 showed the leftward cradling bias (Grüsser, Selke & Zynda 1988). As the left hemiface is usually larger than the right, in women the left breast is usually larger than the right (Loughry, Sheffer, Price *et al* 1989).

124 Salk 1973. Dagenbach, Harris & Fitzgerald (1988) give an overview of the literature, concluding that cradling bias is not a function of handedness.

There are some useful reflections on the relationship between poetry and the right hemisphere in Kane 2004. The distinction has been confirmed by a priming paradigm (Chettih, Durgin & Grodner 2012).
- 189** Schmidt, DeBuse & Seger 2007.

190 Mashal & Faust 2008. Every study that I am aware of in which there has been a failure to find right hemisphere recruitment during metaphor comprehension was *both* a scanning study *and* employed only familiar or conventional metaphors, which cannot be expected to recruit the right hemisphere (Rapp, Leube, Erb *et al* 2004; Rapp, Leube, Erb *et al* 2007; Lee & Dapretto 2006). Thus, according to the authors of one such paper, ‘the metaphors in our study were very simple statements, so-called predicate metaphors (eg, “the alarm clock is a torturer”)’ (Rapp, Leube, Erb *et al* 2004). Reference to ‘torture’ is an overused way of expressing displeasure – ‘it was torture having to drag myself out of bed this morning’. Another study was able to differentiate phrases such as ‘rainclouds are pregnant ghosts’ (appreciated by the right hemisphere) from ‘babies are angels’ (appreciated by the left) (Schmidt, DeBuse and Seger 2007). Bottini and colleagues (Bottini, Corcoran, Sterzi *et al* 1994), who found a right hemisphere pre-eminence, used phrases that still required the bringing together of two distinct ideas, eg, ‘the policeman who didn’t give straight answers was jumping ditches’. Lee & Dapretto, who found no such right hemisphere pre-eminence in metaphor, used single word sequences to exhibit the so-called ‘figurative’ meaning of, for example, the word ‘quick’ (‘slow – quick – fast’ versus ‘slow – quick – smart’), or ‘cold’ meaning unfriendly, examples which have little or no metaphoric status, lack the context in which they could be seen to be metaphorical, and are, in any case, routine, if not banal (Lee *et al*, *op cit*). The study of Stringaris and colleagues was similarly unlikely to test true metaphorical understanding; indeed, the paradigm ‘metaphor’ they report using – ‘some surgeons are butchers’ – is hardly a metaphor at all (Stringaris, Medford, Giampietro *et al* 2007). While such examples probably do involve some low-level RH processing, there is no ‘spike’ in use, because the brain does not register anything to be ‘worked out’ – it’s not experienced as different from saying ‘some surgeons are brutal (or insensitive, or clumsy)’.

- 21 Left hemisphere language areas have an effect on perception: it is important to make a distinction between tasks in which categorisation or naming is involved and those in which they are not (Barnett 2008). Prior to acquisition of linguistic labels, even colour categorisation is right hemisphere-dependent; after learning colour names, categorisation of colours (not perceptual discrimination) migrates to the left hemisphere (Franklin, Drivonikou, Bevis *et al* 2008; Franklin, Drivonikou, Clifford *et al* 2008). However, colour discrimination remains principally right hemisphere-dependent: Denes & Pizzamiglio 1999 (399); Eysenck 2000 (95); De Renzi & Spinnler 1967; Scotti & Spinnler 1970; Davidoff 1976; Hannay 1979; Pennal 1977; Sasaki, Morimoto, Nishio *et al* 2007; Brewer, Liu, Wade *et al* 2005; Howard, ffytche, Barnes *et al* 1998; Kosslyn, Thompson, Costantini-Ferrando *et al* 2000; Njemanze, Gomez & Horenstein 1992; Mendola, Rizzo, Cosgrove *et al* 1999; Clapp, Kirk, Hausmann 2007; Levy & Trevarthen 1981; Barnett 2008; Pirot, Pulton & Sutker 1977; Pallis 1955. 8. CREATIVITY

1 Shelley 1921 (53). His essay, *A Defence of Poetry*, was written in 1821, though first published posthumously in 1840.

2 Lichtenberg 1967–72b (411), *Sudelbuch K*, §76: » Es denkt, *sollte man sagen, so wie man sagt*: es blitzt «. Lichtenberg is not just making the point that Descartes overstepped his own principles by assuming the existence of a thinking *subject* over and above the observable phenomenon of thinking. He is also offering an insight into the way thoughts come with an energy of their own – ‘in a flash’, as we say.

3 Ducatez, Sol, Sayol *et al* 2020; Sol 2003.

4 McDermott, Szpunar & Christ 2009; Roediger & McDermott 2013.

5 Martindale 1999.

6 Wallas 1926.

7 Lindell 2011.

8 Guilford 1967.

9 Cropley 2006.

10 As many readers will know, the answer is four; but demonstrating why that is the case is far from straightforward. It has been demonstrated by computer (Appel, Haken & Koch 1977), but this gives rise to a question about the nature of proof, since it is impossible for the proof to be surveyed by a human being within a lifetime, and the result is accepted on the basis that a ‘computer tells us so’ (see Tymoczko 1979).

11 Schopenhauer 2000, vol II (391): ‘Talent is like the marksman who hits a target which others cannot reach; genius is like the marksman who hits a target, as far as which others cannot even see’.

12 Asimov 2014.

13 Poincaré 1913c (386); cf 1914 (51). Poincaré’s *Science et Méthode* was translated into English almost simultaneously by Halsted (publ 1913) and Maitland (publ 1914). Each version has its strengths, and I have selected whichever seemed to me superior in any one case, but for the reader’s convenience I have always indicated where the corresponding passage may be found in the other text.

14 Steve Jobs, interviewed by Gary Wolf: www.wired.com/1996/02/jobs-2/.

15 Heraclitus fr IX [Diels 35, Marcovich 7] (trans C Kahn). Throughout this book, I use the notation of Charles Kahn’s *The Art and Thought of Heraclitus* (Cambridge University Press, 1979) but give both Diels’s and Marcovich’s numbers for reference.

16 Förster, Friedman & Liberman 2004.

17 This is broadly in line with Herbert Simon’s views on creativity (Simon 1983, 4569).

18 Asari, Konishi, Jimura *et al* 2008. See also McGilchrist 2009b (51ff *et passim*).

- [44](#) Lorenz 1971, vol 2 (xxi–xxiii: emphasis in original). In similar vein, see Polányi 1966 (78–9; emphases in original): ‘Science is supposed to be dispassionate. There is indeed an idealisation of this current today, which deems the scientist not only indifferent to the outcome of his surmises, but actually seeking their refutation. This is not only contrary to experience, but logically inconceivable. The surmises of a working scientist are *born of the imagination seeking discovery*. Such effort *risks* defeat but never *seeks* it; it is in fact his craving for success that makes the scientist take the risk of failure. There is no other way.’

118 ‘Златю Бояджиев бил работохолик, не обичал парите’, *Sega Magazine*, 5 July 2003, retrievable at <https://old.segabg.com/article.php?id=94871>.

This article is wrongly cited by Wikipedia as the source for its own statement that his ‘style changed radically in the direction of grotesque imagery, the inclusion of dozens of shapes in compositions and expressive colour’. It says no such thing. Indeed his portraits done after the stroke are extraordinary for their lively, warm, evocation of the sitter.

137 Zaimov, Kitov & Kolev 1969 (the case of Zlatio Boiyadjiev referred to above); Boller, Sinforiani, Mazzucchi 2005 (also referred to above).

138 Jung 1974. Zaidel’s reference here is taken from – or alternatively is the origin of – a number of places in the literature where it has been faithfully copied by a succession of scholars who would presumably have learnt little from it, had they looked at it, since in the faithfully copied version its title is not so much German as gibberish.

139 Bätzner & Hennerici 2007.

- 231** The ‘Capriccio on the departure of a beloved brother’ in B-flat major, BWV 992, described by the composer Hubert Parry as ‘the most dexterous piece of work of the kind that had ever appeared in the world up to that time’. And yet it is also quite different from anything else Bach wrote subsequently. Fully to appreciate its beauty, I recommend the live recording made by Tatiana Nikolayeva in 1982: www.youtube.com/watch?v=E227g8sv1SE.
- 232** The authenticity of this text has been much doubted and is considered by some to be a forgery. It was first mentioned in the *Allgemeine Musikalische Zeitung*, 24, for 23 August 1815, but was made better known by its inclusion in the appendix to Otto Jahn’s biography (1858, vol iii, suppl 21, 498–9). Jahn himself believed that, while it could not be Mozart’s *ipsissima verba*, it was probably based on a letter of Mozart’s which had been revised and embellished by the musicologist Rochlitz. Its contents are nonetheless in accord with so many asides in letters to his father and others about his composing process that it could be thought of as a compendium or distillation of his experience. The text here translated reads in German: » *Wie nämlich meine Art ist beym Schreiben und Ausarbeiten von großen und derben Sachen nämlich? – Ich kann darüber wahrlich nicht mehr sagen als das; denn ich weiß selbst nicht mehr, und kann auf weiter nichts kommen. Wenn ich recht für mich bin und guter Dinge, etwa auf Reisen im Wagen, oder nach guter Mahlzeit beym Spazieren, und in der Nacht, wenn ich nicht schlafen kann, da kommen mir die Gedanken stromweis und am besten. Woher und wie, das weiß ich nicht, kann auch nichts dazu. Die mir nun gefallen, die behalte ich im Kopf und*

summe sie wol auch vor mich hin, wie mir Andere wenigstens gesagt haben. Halt' ich das nun fest, so kömmt mir bald Eins nach dem Andern bey, wozu so ein Brocken zu brauchen wäre, um eine Pastete daraus zu machen, nach Contrapunkt, nach Klang der verschiedenen Instrumente etc. etc. etc. Das erhitzt mir nun die Seele, wenn ich nämlich nicht gestört werde; da wird es immer größer; und ich breite es immer weiter und heller aus; und das Ding wird im Kopf wahrlich fast fertig, wenn es auch lang ist, so daß ich's hernach mit Einem Blick, gleichsam wie ein schönes Bild oder einen hübschen Menschen, im Geist übersehe, und es auch gar nicht nacheinander wie es hernach kommen muß, in der Einbildung höre, sondern wie gleich alles zusammen. ... Wenn ich nun hernach einmal zum Schreiben komme, so nehme ich aus dem Sack meines Gehirns, was vorher, wie gesagt, hinein gesammelt ist. Darum kömmt es hernach auch ziemlich schnell aufs Papier; denn es ist, wie gesagt, eigentlich schon fertig und wird auch selten viel anders, als es vorher im Kopf gewesen ist. Darum kann ich mich auch bey dem Schreiben stören lassen; und mag um mich herum mancherley vorgehen: ich schreibe doch; kann auch dabey plaudern, nämlich von Hühnern und Gänsen, oder von Gretel und Bärbel u. dgl. Wie nun aber über dem Arbeiten meine Sachen überhaupt eben die Gestalt oder Manier annehmen, daß sie mozartisch sind, und nicht in der Manier irgend eines Andern: das wird halt eben so zugehen, wie, daß meine Nase eben so groß und herausgebogen, daß sie mozartisch und nicht wie bey andern Leuten geworden ist! Denn ich lege es nicht auf Besonderheit an, wüßte die meine auch nicht einmal näher zu beschreiben; es ist ja aber wol blos natürlich, daß die Leute, die wirklich ein Aussehen haben, auch verschieden von einander aussehen, wie von aussen, so von innen. Wenigstens weiß ich, daß ich mir das Eine so wenig, als das Andere gegeben habe. «

237 According to the memoirs of Picasso by the artist and writer 'Brassaï' (real name Gyula Halász), when asked whether his ideas came to him 'by chance or by design', Picasso replied: 'I don't have a clue. Ideas are simply starting points. I can rarely set them down as they come to my mind. As soon as I start to work, others well up in my pen. To know what you're going to draw, you have to begin drawing ... When I find myself facing a blank page, that's always going through my head. What I capture in spite of myself interests me more than my own ideas ... Matisse does a drawing, then he recopies it. He recopies it five times, ten times, each time with cleaner lines. He is persuaded that the last one, the most spare, is the best, the purest, the definitive one; and yet, usually it's the first. When it comes to drawing, nothing is better than the first sketch' (Brassaï 1999, 66). Another record of Picasso on his own creative process suggests, as does the above, something very far from the assembly line model beloved of Dietrich: 'A picture comes to me from far off, who knows how far, I divined it, I saw it, I made it, and yet next day I myself don't see what I have done. How can one penetrate my dreams, my instincts, which have taken a long time to elaborate themselves and bring themselves to the light, above all seize in them what I brought about, perhaps, against my will?' (Zervos 1935; trans B Ghiselin, in Ghiselin 1985, 52).

The brain correlates of mood are complex: they can vary markedly, definitely depend on a balance between anterior and posterior (dys)function (Tucker, Stenslie, Roth *et al* 1981) and may differ by sex and handedness (Bartolic, Basso, Schefft *et al* 1999), as well as being sensitive to context. Nonetheless overall a connexion between the right hemisphere and sadness or melancholy and the left hemisphere and euphoria appears to be robust.

9. WHAT SCHIZOPHRENIA AND AUTISM CAN TELL US

1 Bergson 1920 (47).

2 Carel 2013 (345: emphasis in original).

3 James 1902 (22).

4 For this reason, it is impossible to understand mental illness from ‘outside’, as if inspecting a machine that has a malfunctioning part. An ill person *must be understood from within*, as embodying a whole new way of being in the world. Thus the great psychiatrist Eugène Minkowski speaks of ‘the need to enter, with one leap, into the soul of the other’ – « *le besoin de pénétrer, en un seul acte, toute son âme* » (Minkowski 1997, 99–100). He contrasts what he calls inductive and intuitive understanding, and remarks that ‘the latter is in no way less important in life than the former: we very often call on it, and many times it constitutes the supreme criterion, far superior to all others’ – « *ce dernier mode de connaissance n’est nullement moins important dans la vie que le premier: nous y faisons appel bien souvent, et bien des fois il constitue le critère suprême, de beaucoup supérieur à tous les autres* » (*ibid*, 100).

5 This is true of all mental illnesses, but not in the same degree. It is pervasive in what are called the major mental illnesses: severe depression, bipolar disorder and schizophrenia. In some illnesses, such as obsessive-compulsive disorder and generalised anxiety disorder, for example, the degree to which reality is altered is not usually as pervasive – though sometimes it may be. And in some illnesses the problem is fairly well encapsulated, as psychiatrists say: it confines its expression to defined areas of experience, leaving much of the rest of life more or less unaltered.

6 Carroll & Owen 2009; Burbach & van der Zwaag 2009; Sullivan, Magnusson, Reichenberg *et al* 2012.

7 Autism is, in my view, not a unitary condition. In keeping with this, I believe, on the one hand, that the variety of presentations of autism is so great that we should talk about autisms, rather than autism; and it is well recognised that schizophrenia, too, takes many different forms. Added to which, there are conditions such as schizotypy and schizoid personality which are distinguishable from one another and from schizophrenia, though still forming part of what psychiatrists call the schizoid autistic, or schizo-autistic, spectrum. On the other hand, these conditions are grouped together precisely because of their having a large number of common characteristics: and it is with these that we will be concerned.

8 Sustained attention in autism: Chien, Gau, Shang *et al* 2015; Garretson, Fein & Waterhouse 1990; Vivanti, Fanning, Hocking *et al* 2017; sustained attention in schizophrenia: Nuechterlein & Dawson 1984; Asarnow & MacCrimmon 1981; sustained attention in modernity: Lorenz-Spreen, Mønsted, Hövel *et al* 2019. Face reading in schizophrenia; Kohler, Walker, Martin *et al* 2010; face reading in schizophrenia and autism: Ciaramidaro, Bölte, Schlitt *et al* 2018: ‘our findings are consistent with a common neural deficit during implicit negative facial affect recognition in schizophrenia and autism spectrum disorders’; face reading in autism: Gross 2004; Schultz 2005; face reading in modernity: Uhls, Michikyan, Morris *et al* 2014. Empathy in schizophrenia: Bora, Gökçen & Veznedaroglu 2008; Bonfils, Lysaker, Minor *et al* 2016; empathy in autism: Harmsen 2019; empathy in modernity: Konrath, O’Brien & Hsing 2011.

9 Indeed, as Claude Braun and Sabrina Suffren have argued in examining subjects with unilateral brain lesions, it may well be the unbridled cognitive propensities of the left hemisphere, specifically jumping to conclusions and excessive reference to the self, which are the primary factors in delusional thinking – the situation merely being compounded by, not necessarily grounded in, the

perceptual or cognitive deficits that accompany right hemisphere dysfunction: ‘left hemisphere release appears to be a more primary cause of delusional disorder than right hemisphere impairment, the latter merely entailing loss of *inhibition* of delusional beliefs’ (Braun & Suffren 2011: emphasis in original).

10 Cutting 1994b. See also Langdon, Coltheart, Ward *et al* 2002; Mitchell & Crow 2005; Schettino, Lauro, Crippa *et al* 2010; Borod, Martin, Alpert *et al* 1993; Ferman, Primeau, Delis *et al* 1999; Schweitzer 1982; Cohen, Iglesias & Minor 2009.

11 Coltheart, Langdon & McKay 2007. For further detail, see Chapter 4.

12 Ross, Orbelo, Cartwright *et al* 2001.

13 Cutting & Murphy 1990.

14 Bruell & Albee 1962.

15 Hari, Hänninen, Mäkinen *et al* 1998; Mesulam 2000b; Devinsky 2000. See also the extensive evidence for the connexion between somatoparaphrenia and right hemisphere deficits.

16 Tsakiris, Costantini & Haggard 2008; Lyons & Fitzgerald 2013; Allison, Puce & McCarthy 2000; Hein & Knight 2008; Redcay 2008; Carrington & Bailey 2009. For evidence that the right superior temporal sulcus is critical for understanding bodily motion, see Grossman, Battelli & Pascual-Leone 2005; van Kemenade, Muggleton, Walsh *et al* 2012.

17 Frassinetti, Pavani, Zamagni *et al* 2009; Frassinetti, Maini, Romualdi *et al* 2008; Sugiura, Sassa, Jeong *et al* 2008; Kaplan, Aziz-Zadeh, Uddin *et al* 2008; Rosa, Lassonde, Pinard *et al* 2008; Morita, Itakura, Saito *et al* 2008; Farrer, Franck, Georgieff *et al* 2003. The sense of body ownership is highly dependent on the right inferior parietal lobe and the right temporoparietal junction (Ehrsson, Holmes & Passingham 2005; Tsakiris, Costantini & Haggard 2008). Both of these areas are dysfunctional in schizophrenia spectrum disorders (Arzy, Mohr, Michel *et al* 2007; Torrey 2007).

18 In schizophrenia: bodily integrity: McGilchrist & Cutting 1995; biological motion perception: Kim, Park & Blake 2011; self-face recognition: Irani, Platek, Panyavin *et al* 2006; Kircher, Seiferth, Plewnia *et al* 2007. In autism: bodily integrity may be, but is not commonly, compromised; biological motion perception: Freitag, Konrad, Häberlen *et al* 2008; Todorova, Hatton & Pollick 2019; self-face recognition: Uddin, Davies, Scott *et al* 2008.

19 See, eg, Silverstein & Palumbo 1995.

20 For schizophrenia, see Foussias & Remington 2010; Sayers, Curran & Mueser 1996; Mueser, Sayers, Schooler *et al* 1994.

21 For schizophrenia, see Cohen, Iglesias & Minor 2009; Vaskinn, Sundet, Østefjells *et al* 2016.

22 For schizophrenia, see Hough 1990; Stuss, Gallup & Alexander 2001; Stuss & Alexander 2000; Stuss, Picton & Alexander 2001; Stuss 1991b; Gallagher 2003; Tavano, Sponda, Fabbro *et al* 2008.

23 Schneiderman, Murasugi & Saddy 1992.

32 Ferman *et al*, *op cit*.

33 Reich & Cutting 1982.

34 55 out of 60 studies: see Uhlhaas & Silverstein 2005; and the follow-up paper, taking into account a further five years of research, Silverstein & Keane 2011. See also particularly, in addition to papers already mentioned: Andersch, 2016; Brand, Kopmann, Marbach *et al* 2005; Hemsley 1994; Gray, Feldon, Rawlins *et al* 1991; Rabinowicz, Opler, Owen *et al* 1996; Silverstein, Bakshi, Chapman *et al* 1998; Matussek 1987. See also Place & Gilmore 1980; Watt & Phillips 2000; Uhlhaas & Silverstein 2005; Granholm, Perry, Filoteo *et al* 1999; Frith, Stevens, Johnstone *et al* 1983. Dysfunctional perceptual organisation is particularly to be found in chronic patients (Parnas, Vianin, Saebye *et al* 2001). A small number of studies have found a global-processing advantage for schizophrenia patients, eg, Bellgrove, Vance & Bradshaw 2003; Carter, Robertson, Nordahl *et al* 1996; Granholm, Perry, Filoteo *et al* 1999. However, 'a global advantage was found only for the condition in which attention was divided between the local and global levels and there was an equal probability of the target appearing at both levels' (Uhlhaas & Silverstein 2005). On poorer outcomes, see especially Silverstein, Schenkel, Valone *et al* 1998.

35 Uhlhaas & Silverstein 2005 (628: emphasis added).

55 Schultze-Lutter 2009. Schizophrenic subjects have also been found to be *disorientated* in time (De La Garza & Worchel 1956), but in my view this might simply reflect institutional living. Minkowski pointed out early on: '[A schizophrenic] usually knows the date, but the knowledge has no precise meaning for him; he cannot use it in a fashion appropriate to his circumstances. The *pragmatic* use of things is affected early in this condition' (Minkowski 1987, 197). Yet I have seen a virtually mute inpatient with schizophrenia suddenly state clearly and correctly that his treatment order expired the following day.

56 McGilchrist & Cutting 1995.

57 Nasar 2011 (258).

58 Eg, Gruber, Mangat & Abou-Taleb 1984: 'Twenty-nine of 54 subjects with auditory hallucinations were able, when asked, to localize the voices to the left or right ear. Subjects who heard voices on the right were found to be significantly more depressed than the others'.

59 Schechter 2000 (14): Paul Erdős, the highly eccentric autistic mathematical genius, lived most of his life out of a suitcase and was of no fixed abode; he used to appear at the door of anyone he thought might accommodate him, feed him and otherwise parent him, uttering the words 'my *brain* is open'.

60 When depression becomes psychotic, it seems to involve right hemisphere dysfunction.

61 McGilchrist & Cutting 1995. Karl Jaspers famously spoke of the 'ununderstandable' as a sign of schizophreniform psychosis (Jaspers 1963, 577). While it has been since argued that all delusions are understandable, this usually means resorting to unverifiable and often far-fetched psychodynamic interpretations, and the common sense meaning of Jaspers' description is clearly right.

62 Hypergyria and white matter deficits in the right hemisphere are reported (Narr, Bilder, Kim *et al* 2004; Vogeley, Tepest, Pfeiffer *et al* 2001). There are altered right orbitofrontal sulcal-gyral patterns in the right hemisphere (Nakamura, Nestor, McCarley *et al* 2007; Lavoie, Bartholomeuz, Nelson *et al* 2014). There is white matter reduction in right parietal and subcortical regions (Zetzsche, Preuss, Frodl *et al* 2008). White matter growth is slower in the right hemisphere of very early onset patients as compared with healthy controls (Gogtay, Lu, Leow *et al* 2008). The superior longitudinal fasciculus, a crucial integrating white matter tract, is compromised in the right hemisphere (Rowland, Spieker, Francis *et al* 2009). There are abnormalities of grey matter in the right inferior parietal lobe (Shapleske, Rossell, Chitnis *et al* 2002). There is grey matter reduction in the right insular region (Takahashi, Wood, Yung *et al* 2009). There are reduced neuronal connexions to the right thalamus (Mileaf & Byne 2012). Cognitive deficits in schizophrenia correlate closely with diminished grey matter volumes in specifically the right hippocampus (Liu, Li, Liu *et al* 2020). However, one study found abnormalities of gyrification in both hemispheres, with hypogyria being commoner in the left (Palaniyappan & Liddle 2012).

63 Yuasa, Kurachi, Suzuki *et al* 1995.

64 Schott, Voss, Wagner *et al* 2015.

65 Riehemann, Volz, Stützer *et al* 2001; Hook, Gordon, Lazzaro *et al* 1995; Malaspina, Bruder, Furman *et al* 2000.

66 Deicken, Calabrese, Merrin *et al* 1994.

67 Gallinat, Winterer, Herrmann *et al* 2004. There is lower amplitude of the N160 complex in the right hemisphere (Endrass, Mohr & Rockstroh 2002), a result that is interpreted as a consequence of the loss of rapidly conducting myelinated axons in the right hemisphere. The (normally) more rapid right-to-left interhemispheric transfer times are comparatively slower in patients with schizophrenia (Endrass, Mohr & Rockstroh 2002; Barnett, Corballis & Kirk 2005).

68 Lacroix, Chaput, Rodriguez *et al* 1995.

69 Dolina, Efimova, Kildyushov *et al* 2017.

70 Schizophrenia: see, eg, Barta, Petty, McGilchrist *et al* 1995; Barta, Pearlson, Brill *et al* 1997; Tiihonen, Katila, Pekkonen *et al* 1998; Petty 1999; Mitchell & Crow 2005; Rentería 2012; McKenna, Babb, Miles *et al* 2020; Sun, Chen, Collinson *et al* 2017; Fallgatter & Strik 2000; Hori, Ozeki, Terada *et al* 2008. See also Spironelli, Angrilli & Stegagno 2008; Dollfus, Razafimandimby, Delamillieure *et al* 2005; Sommer, Ramsey & Kahn 2001; Weiss, Hofer, Golaszewski *et al* 2006; Sommer, Ramsey, Mandl *et al* 2003. Autism: Carper, Treiber, DeJesus *et al* 2016; Postema, van Rooij, Anagnostou *et al* 2019.

71 Endrass, Mohr & Rockstroh 2002; Nowicka & Tacikowski 2011; Barnett, Corballis & Kirk 2005.

72 Rotarska-Jagiela, van de Ven, Oertel-Knöchel *et al* 2010; Jalili, Meuli, Do *et al* 2010; Ke, Zou, Shen *et al* 2010; Andreou, Nolte, Leicht *et al* 2014. However, as the same study shows, chronic patients with more pronounced negative symptoms show increased rightward asymmetry of functional connectivity: with disease progression, the left hemisphere symptoms and function appear to ‘burn out’.

73 Petty 1999; Barta, Petty, McGilchrist *et al* 1995; Petty, Barta, Pearlson *et al* 1995; Barta, Pearlson, Brill *et al* 1997; Spironelli, Angrilli & Stegagno 2008; Dollfus, Razafimandimby, Delamillieure *et al* 2005; Sommer, Ramsey & Kahn 2001; Weiss, Hofer, Golaszewski *et al* 2006; Sommer, Ramsey, Mandl *et al* 2003; Oertel, Knöchel, Rotarska-Jagiela *et al* 2010. There is also a similar reduction in leftward asymmetry in this area in the relatives of those with schizophrenia (Oertel-Knöchel, Knöchel, Matura *et al* 2013). For discussion of asymmetry of the planum temporale, see McGilchrist 2009b (23, 465 & 485).

74 One of many findings that suggest this possibility is that inability to appreciate music is related to greater cortical thickness in the left temporal region in normal subjects, and to lesser cortical thickness in the left temporal region in schizophrenia (Fujito, Mineise, Hatada *et al* 2018).

75 Dias 2012.

76 Relation between corpus callosum morphology and schizophrenia: David 1994; Woodruff, Pearlson, Geer *et al* 1993; Woodruff, McManus & David 1995; Cogger & Serafetinides 1990; Rosenthal & Bigelow 1972; Günther, Petsch, Steinberg *et al* 1991; Swayze, Andreasen, Erhardt *et al* 1990; Arnone, McIntosh, Tan *et al* 2008; Walterfang, Wood, Reutens *et al* 2008; Walterfang, Wood, Reutens *et al* 2009; Bersani, Quartini, Iannitelli *et al* 2010. Relation between agenesis of the corpus callosum and schizophrenia: Hallak, Crippa, Pinto *et al* 2007; Motomura, Satani & Inaba 2002. Relation between callosal agenesis and delusional syndromes: Görgülü, Alparslan & Uygur 2010; Bhatia, Saha & Doval 2016.

77 David 1994. The article is a concise and thoughtful survey of problems typically associated with making clear connexions between the callosum and schizophrenia.

78 Specifically the right superior longitudinal fasciculus, right middle longitudinal fasciculus, and right uncinate fasciculus, but also the left thalamo-occipital fasciculus (Joo, Yoon, Shon *et al* 2018; Kubicki, McCarley & Shenton 2005). And see Chapter 6 for further details.

79 Rockstroh & Lutzenberger 1987; Gur & Gur 1987. EEG studies show increases in power in the left hemisphere, especially frontal areas, including the cingulate cortex (Andreou, Faber, Leicht *et al* 2014; Bochkarev, Kirenskaya, Tkachenko *et al* 2015). A left-sided ictal (hyper-excitable) focus is

associated with a schizophrenia-like psychosis, while a right-sided focus is associated more with depression (Oyeboode 2008; Sherwin, Peron-Magnan, Bancaud *et al* 1982; Perez, Trimble, Murray *et al* 1985; Sherwin 1981; Flor-Henry 1969a; Kan, Mori, Suzuki *et al* 1989). Patients with schizophrenia (and bipolar disorder) may display left-lateralisation of the normal right-lateralised temporal lobe response to emotional expression in speech (Mitchell, Elliott, Barry *et al* 2004).

80 Raine, Andrews, Sheard *et al* 1989; Saban-Bezael & Mashal 2017.

81 See, for example, Gur, Resnick, Alavi *et al* 1987; Goldman-Rakic & Selemon 1997; van Veelen, Vink, Ramsey *et al* 2010; Jibiki, Matsuda, Yamaguchi *et al* 1992. One interesting corroboration is that eye-blink rate is a recognised marker of dopaminergic function: higher levels of dopamine are associated with increased eye-blinking (see, eg, Karson 1983; Kleven & Koek 1996). Not surprisingly, therefore, schizophrenic subjects also have high eye-blink rates (Karson, Dykman & Paige 1990; Mackert, Flechtner, Woyth *et al* 1991). In such high-dopamine subjects the normal asymmetry of attention in favour of the left visual field (right hemisphere) is reversed (Slagter, Davidson & Tomer 2010). Equally, inattention to the left visual field, commonly found in ADHD, is reversed by *blocking* dopamine transmission (Sheppard, Bradshaw, Mattingley *et al* 1999). Autistic subjects also have elevated rates of eye-blinking (Goldberg, Maltz, Bow *et al* 1987).

82 Glick, Ross & Hough 1982; Tucker & Williamson 1984; Mintz, Tomer & Myslobodsky 1982; Wagner, Burns, Dannals *et al* 1983; Laurian, Gaillard, Le *et al* 1983; Gottfries, Perris & Roos 1974. See, however, Tomer & Flor-Henry 1989 for a reverse finding.

88 Levine, Toder, Geller *et al* 2012.

89 Nagara, Ohara & Yano 1996. Also relevant is a paper by Jensen & Larsen (1979). This report includes three schizophrenia-like psychotic patients. One ('patient 72') was psychotic, and the psychosis was relieved by left temporal lobectomy. Another ('patient 11') was non-psychotic, and the psychosis was precipitated by right temporal lobectomy. The third ('patient 44'), however, was pre-operatively psychotic and her psychosis was relieved by right temporal lobectomy.

- 142** Barnea-Goraly, Kwon, Menon *et al* 2004. There are two possible ways by which this might come about, and at present I do not know of evidence that would help distinguish the possibilities. One depends on the facilitatory role of the corpus callosum, the other on its important role in inhibition (see, eg, David 1993; Whitfield-Gabrieli, Thermenos, Milanovic *et al* 2009). Abnormalities may have the overall effect of impairing the capacity for one hemisphere to inhibit the other. Remember that facilitatory transmission in schizophrenia is enhanced relative to inhibitory transmission (Stone, Morrison & Pilowsky 2007; Javitt 2007; Morgan & Curran, 2006; Krystal, Karper, Seibyl *et al* 1994). In other words, in the absence of a normally functioning corpus callosum, either the right hemisphere cannot contribute adequately to left hemisphere function, or it cannot adequately inhibit the left hemisphere from interfering in right hemisphere function. Or both. Each would lead to a similar picture.

- 157** Gall 1835, vol 2 (165). Notwithstanding, Gall describes her as ‘a woman of infinite sense’.

158 These have all been demonstrated in the earlier chapters of Part I; for a brief overview of problems of the self in right hemisphere impairment, see Feinberg 2013.

159 Cutting 1994a (76).

160 Laing 1963.

161 Minkowski 2002 (144). As he reports, these observations were first made in this form by his wife, Françoise Minkowska-Brokman: « *la vie chez lui est opposée au plan; l'instinct est opposé au cerveau; le senti est opposé au pensé; la faculté de la pénétration qui synthétise est opposée à l'analyse des détails infimes; là où nous nous fions aux impressions, lui exige des preuves; le mouvement s'oppose chez lui à l'immobilité; les événements et personnes s'opposent aux objets; la réalisation s'oppose à la représentation; le but s'oppose à la base; le temps s'oppose à l'espace; la succession s'oppose à l'extension. Les facteurs indiqués dans la première colonne de ce schéma font défaut, ceux de la seconde, par contre, sont hypertrophiés* » (Minkowska 1925, 135).

168 McGhie & Chapman 1961 (104–5).

169 Matussek 1987 (92).

170 Minkowska 1925 (130: emphasis in original): « *Ainsi toute son activité est réglée par l'idée du plan qui forcément ne s'applique qu'aux objets immuables; l'ensemble échappe à notre malade, il ne voit que les parties isolées et ne progresse point. Pour élaborer son plan, il ne se sert que de ses forces cérébrales, car l'instinct, comme il le dit, lui fait défaut. Un jour, il est question de musique; il déclare que ce n'est pour lui qu'une succession de sons; 'Je ne sais pas sentir, il faut que tout passe par le cerveau'.* »

171 Matussek 1987 (92).

200 Iacoboni, Woods, Brass *et al* 1999.

201 Cutting 1997 (318).

202 A diminished sense of self and tendency to blame others are also features of borderline personality disorder. Here, too, it has been posited that the core deficits are in the right hemisphere – see, eg, Meares, Schore & Melkonian 2011; Chanen, Velakoulis, Carison *et al* 2008; Irle, Lange & Sachsse 2005; Irle, Lange, Weniger *et al* 2007; de la Fuente, Goldman, Stanus *et al* 1997. But there are some findings of left hemisphere abnormalities (eg, Whittle, Chanen, Fornito *et al* 2009) and the findings are made harder still to interpret because studies involving both male and female subjects analysed separately are unusual, the diagnosis is not always robust, and abnormalities may be represented by both larger and smaller volumes than usual, and by both under- and over- activity.

203 Minkowski 2002 (122: emphasis added in translation): « *Tout est immobilité autour de moi. Les choses se présentent isolément, chacune pour soi, sans rien évoquer. Certaines choses qui devraient former un souvenir, évoquer une immensité de pensées, donner un tableau, restent isolées. Elles sont plutôt comprises qu'éprouvées. C'est comme des pantomimes, pantomimes qu'on jouerait autour de moi, mais je n'y entre pas, je reste en dehors. J'ai mon jugement, mais l'instinct de la vie me manque. Je ne parviens plus à donner mon activité d'une façon suffisamment vivante. Je ne puis plus passer des cordes douces aux cordes tendues, et pourtant on n'est pas fait pour vivre sur le même thème. J'ai perdu le contact avec toutes espèces de choses. La notion de la valeur, de la difficulté des choses a disparu. Il n'y a plus de courant entre elles et moi, je ne peux plus m'y abandonner. C'est une fixité absolue autour de moi. J'ai encore moins de mobilité pour l'avenir que pour le présent et le passé. Il y a en moi comme une sorte de routine qui ne permet pas d'envisager l'avenir. Le pouvoir créateur est aboli en moi. Je vois l'avenir comme répétition du passé* ».

204 Sass 2017 (xi).

205 Jaspers 1963 (81).

206 Schreber was an appellate judge in late nineteenth-century Dresden, whose highly articulate accounts of the onset of schizophrenia in middle age became the focus of Freud's only major study of a psychotic illness – see Sass 1994 (esp here 93).

207 Sass 2017 (x).

296 Eliot, 'Whispers of immortality'.

297 Leader 2012 (222).

298 Tatossian 2014a: « *Je suis une femme entièrement transparente. (Je suis ainsi contactée par les Scientifiques du moment qui peuvent enregistrer tous les Mouvements de ma circulation du sang – mon cœur – poumons – vessie – viscères.)* » (35); and: « *Toutes les réactions naturelles ou provoquées du corps humain peuvent toutes être reproduites sur un tableau tel une carte d'état-major du corps humain* » (94).

299 Jaspers 1963 (117).

300 Sass & Borda 2015.

301 Tatossian 2014a (76–7) : « *Pour Hélène la nature est Néant car elle se place irréparablement en dehors du monde, vécu comme exclusivement 'complexe référentiel d'outils'. En aucun passage du mémoire, même lors de certaines envolées lyriques, la nature n'apparaît: Hélène n'a pas 'le sentiment de la nature' et cette absence a valeur existentielle et non purement littéraire. Les espaces favoris d'Hélène sont les espaces des villes; mieux, ce sont les seuls espaces qu'elle peut 'prendre au sérieux'* ».

302 *ibid* (77).

303 Dide & Guiraud 1929 (224): « *L'affection se caractérise par un fléchissement d'emblée et précoce des sources instinctives de la vie mentale ... l'affaiblissement de l'élan vital et de l'affectivité étant l'élément nécessaire et suffisant pour caractériser la maladie.* »

304 Nietzsche 1956 (217).

305 Nietzsche 1999 (4 & 109).

306 Schwartz, Wiggins, Naudin *et al* 2005.

307 de Haan & Fuchs 2010.

308 Kretschmer 1925 (177).

309 Binswanger 2010 (35ff): » *Ein Vater legt seiner krebskranker Tochter einen Sarg unter den Weihnachtsbaum.* «

310 Blankenburg 1966: » *Schwierige, intellektuell besonders hohe Anforderungen stellende Aufgaben werden dagegen zu diesem Zeitpunkt oft noch ohne große Mühe bewältigt, vor allem solche Aufgaben, deren Aufgabencharakter festliegt, die keiner Interpretation bedürfen. Gelegentlich ziehen sich Kranke in diesem Frühstadium sogar auf das Studium der Mathematik oder Physik zurück. Die vom common sense behütete ‚natürliche Konsequenz‘ versuchen sie durch mehr oder weniger raffinierte logische Ableitungen zu ersetzen.* «

311 Kuhn 1952: » *Er lehnt ‚ein Leben, das nicht und nirgends zu definieren ist‘ ab ... Die Grundrichtung der Tätigkeit des Kranken darin liegt, zuhandenes Zeug aus seinem bewegten Bezug im lebendigen Umgang in bloße Vorhandenheit zu verwandeln* ». I am indebted to Cutting's treatment of the patient (Cutting 2002, 160–2).

312 Minkowski 1970 (278). Such patients recall Nietzsche's descriptions of the Apollonian (and Socratic) mind-sets. Apollo enjoins the seeking of self-knowledge through detached contemplation; Socrates transforms this into 'logical schematism' (Nietzsche 1956, 65 & 88).

313 Mancini, Presenza, Di Bernardo *et al* 2014.

314 Blankenburg 1971 (*passim*); Sass 2017 (175).

315 Blankenburg 1971 (43); as reported in Kim, Takemoto, Mayahara *et al* 1994 (434).

316 Kim, Takemoto, Mayahara *et al* 1994.

317 Colbert & Peters 2002.

318 Parnas, Møller, Kircher *et al* 2005.

319 Minkowski 2002 (141–2: emphases in original): « *Le plan c'est tout pour moi dans la vie* », nous dit encore le malade. « *Je ne veux à aucun prix déranger mon plan, je dérange plutôt la vie que le plan. C'est le goût pour la symétrie, pour la régularité qui m'attire vers mon plan. La vie ne montre ni régularité, ni symétrie et c'est pour ça que je fabrique la réalité. C'est au cerveau que j'attribue toutes mes forces ... Ce que je vais dire paraîtra formidable, mais cela est. Mon état d'esprit actuel consiste à n'ajouter foi qu'à la théorie. Je ne crois à l'existence d'une chose que lorsque je l'ai démontrée. Par exemple, le corps de la femme produit une impression sur l'homme. Pourquoi? Voilà une chose dont je doute, parce que je ne peux pas arriver à la démontrer. Je ne me vois pas arraché par cela, emporté dans l'existence sans point d'appui et me fiant uniquement à mes impressions.* »

320 Rosser 1979 (182).

321 Blankenburg 1971 (46).

322 Sass & Parnas 2001.

323 Blankenburg 1971 (41).

368 Tatossian 2014a (95: emphasis added): « *Ce gigantesque tableau 'où tout ce que je pense s'inscrit en Noir sur Blanc ... aux yeux de l'Univers entier'* ».

369 I am indebted to Jan Zwicky for this observation.

370 Paumgarten (2014), on Aaron Chase: 'He glanced at the trail, looked again to his left, and saw a herd, maybe thirty elk, running at full tilt alongside his bike, like a pod of dolphins chasing a boat. After a moment, they rumbled past him and crossed the trail, neither he nor the elk slowing, dust kicking up and glowing in the early-evening sun, amid a thundering of hooves. It was a magical sight. The light was perfect ... Once the herd was gone, it was as though it'd never been there at all – Sasquatch, E.T., yeti. Pics or it didn't happen ... "It was hell," Chase says now. When the agony of

missing the shot trumps the joy of the experience worth shooting ... the purpose of the trip or trick is the record of it. Life is footage.'

8 That is not to say that there are not so-called animal *models* of schizophrenia, but phenotypically they are far removed from the human condition and are identified by measuring distant proxies, such as startle reflexes, response inhibition, and so on.

9 Gazzaniga 1998.

10 Sacks 1986 (2–3).

10. WHAT IS TRUTH?

1 Agus 1941 (191). The phrase occurs in the context of an explication of the philosophy of Franz Rosenzweig (III.d: ‘Franz Rosenzweig: philosophy of religion’).

2 See Merleau-Ponty 1945 *passim* (esp 160).

3 Wordsworth, ‘Intimations of Immortality from Recollections of Early Childhood’.

4 Jugged hare is a traditional English country dish, involving marinating the hare in red wine with juniper berries, and cooking it slowly with some of the hare’s blood. In France it is known as *civet de lièvre*. Incidentally, the famous Mrs Beeton did not instruct the cook to ‘first catch your hare’, neither did her eighteenth-century predecessor, to whom the phrase has also been attributed (a better source of excellent recipes), Hannah Glasse.

26 There are several ways in which this can be achieved, nowadays most commonly using low-frequency TMS. This experiment was made possible by the existence of patients who were having the administration of electro-convulsive therapy (ECT) as part of their treatment programme: for 15–20 minutes after treatment, the hemisphere to which it has been applied is relatively unresponsive.

27 Chernigovskaya & Deglin 1986 (151: emphasis added).

SCIENCE & TRUTH

1 Tolstoy 2004 (275).

11. SCIENCE'S CLAIMS ON TRUTH

1 Whitehead 1929b (39).

2 Collingwood 1940 (40–1).

3 Ronchi 2014 (xx).

4 Ball 2011.

5 At least no source has been traced to my knowledge. It is usually cited as quoted by Richard Lewontin, but Lewontin doesn't give a source. It has also been repeatedly cited as from Rosenblueth & Wiener 1945, but I cannot find it there, either.

6 For a discussion of the fundamental role of metaphor in language, and particularly in that of science and philosophy, see Lakoff and Johnson 1980 & 1999; also McGilchrist 2009b (115ff).

7 Rosenblueth & Wiener 1945 (320–1).

8 Whitehead 1929b (8: emphasis added).

9 *ibid* (22).

10 Chargaff 1978 (56–7).

11 *ibid* (56).

12 One might want to make an exception of certain transient transcendent states, but arguably they are still experiences involving a human mind.

13 Planck 1932 (217). Similarly George Spencer-Brown says, 'We may take it that the world is undoubtedly itself (ie, is indistinct from itself), but, in any attempt to see itself, as an object, it must, equally undoubtedly act so as to make itself distinct from and therefore false to itself. In this condition, it will always partially elude itself.' And so with each one of us. He continues, 'In this sense, in respect to its own information, the universe *must* expand to escape the telescopes through which we, who are it, are trying to capture it, which is us' (Spencer-Brown 1969, 106: emphasis in original). This was rather wittily reconceived in a short poem by Gerald Grow: 'There's a kind of Uncertainty Principle / Of self-knowledge: / You can never really know yourself, / Because knowing yourself / Changes you' (Grow 2019).

14 James 1902 (320).

15 Chargaff 1978 (123).

16 Einstein, objecting to the placing of observables at the heart of the new quantum mechanics, during Heisenberg's 1926 lecture at Berlin; related by Heisenberg, and quoted in Salam 1990.

17 Hanson 1958 (19).

18 Goodman 2008.

19 Pross 2102 (146).

20 Gleiser 2014 (98–9).

21 Mill 1950 (105: emphasis added). In fact the same point had been made by Leibniz in a letter to Nicolas Rémond, dated 10 January 1714, in which he says: « *J'ay trouvé que la plupart des sectes [sc. philosophiques] ont raison dans une bonne partie de ce qu'elles avancent, mais non pas tant en ce qu'elles nient* » – 'I have found that the majority of [philosophical] sects are largely right in what they put forward, but not to the same extent in what they deny': Leibniz 1887 (607).

22 Whitehead 1954 (19; and *ibid* 276).

23 Whitehead 1929b (43).

24 McGilchrist 2009b (97 & 141–3).

25 Dewey 1931 (212).

26 Taleb 2013 (229 & 109).

27 The first part of this, » *Die Wissenschaft denkt nicht* «, is originally from page 4 of Heidegger's *Was heißt denken?*, the version of his lectures given in Freiburg in 1951–2 published by Max Niemeyer Verlag (1954), and later translated into English (1968). Heidegger then repeated it in a conversation with his pupil the German philosopher Richard Wisser on 17 September 1969, in which he follows it by another phrase in explanation, thus: » *Und dieser Satz: die Wissenschaft denkt nicht, der viel Aufsehen erregte, als ich ihn in einer Freiburger Vorlesung aussprach, bedeutet: Die Wissenschaft bewegt sich nicht in der Dimension der Philosophie. Sie ist aber, ohne daß sie es weiß, auf diese Dimension angewiesen* « [And this sentence 'Science doesn't think', which caused such a stir when I said it in a lecture in Freiburg, means: 'Science doesn't venture into the *realm of philosophy*', etc]. In Heidegger 2000, 702–710 (705: emphasis in original).

28 Aeschliman 1983 (20).

29 Maxwell 2004 (12).

30 Magee 1998a (218).

31 Einstein 1986 (75): » *Höchste Aufgabe des Physikers ist also das Aufsuchen jener allgemeinsten elementaren Gesetze, aus denen durch reine Deduktion das Weltbild zu gewinnen ist. Zu diesen elementaren Gesetzen führt kein logischer Weg, sondern nur die auf Einfühlung in die Erfahrung sich stützende Intuition.* «

32 Skyrms 1984. Skyrms mentions the term causation as indicating, variously: a sufficient condition for the effect; a necessary condition for the effect; a condition of statistical relevance to the effect; an explanation of the effect; a transfer of energy-momentum; the experimental 'manipulability' of effect by cause; and cause viewed as a 'primitive' physical relation. He then goes on to suggest that since the Einstein-Podolsky-Rosen paradox, these cannot be considered adequate, let alone exhaustive.

33 Boyer 1994 (132, n3).

34 Planck 1931b (58–9).

35 'Natural laws are not abstractions fixed once and for all, but sustained processes in which the character of law appears the more definitely the longer they are in operation' – commentary on 'The Great Treatise'; in *I Ching* 1968 (326). I am grateful to Stephen Lowy for bringing this to my notice.

36 Whitehead 1929b (41): 'The pathetic desire of mankind to find themselves starting from an intellectual basis which is clear, distinct, and certain, is illustrated by Newton's boast, *hypotheses non fingo*, at the same time when he enunciated his law of universal gravitation'.

[72](#) Berry 2000 (129). Cf Ortega y Gasset, who already in 1930 described a type of scientist ‘unparalleled in history. He is one who, out of all that has to be known in order to be a man of judgment, is only acquainted with one science, and even of that one only knows the small corner in which he is an active investigator. He even proclaims it as a virtue that he takes no cognisance of what lies outside the narrow territory specially cultivated by himself, and gives the name of “dilettantism” to any curiosity for the general scheme of knowledge’ (Ortega y Gasset 1994, 110).

12. THE SCIENCE OF LIFE: A STUDY IN LEFT HEMISPHERE CAPTURE

1 Leonardo, *Codex Trivulzianus* 2162, 36: ‘*Il moto è causa d’ogni vita*’.

2 Whitehead 1938 (207).

3 Leibniz 1714, §§71–2: « *Car tous les corps sont dans un flux perpétuel comme des rivières; et des parties y entrent et en sortent continuellement. Ainsi l’âme ne change de corps que peu à peu et par degrés, de sorte qu’elle n’est jamais dépouillée tout d’un coup de tous ses organes* » – ‘Thus the soul changes its body only little by little and by degrees, so that it is never deprived of all its organs at once.’

4 Heraclitus fr LII [Diels 84a, Marcovich 56A]. It is pleasingly apt in this context that the word translated as ‘changing’ here, μεταβάλλον, is from the same root as ‘metabolism’ – the process whereby, as I argue, living organisms remain the same by changing. Like many Heraclitean fragments we are reliant on a later writer, here Plotinus, quoting from memory, so it is possible to get too fastidious about translation; but the phrase μεταβάλλον ἀναπαύεται more literally means ‘by changing, it stands still’. However the idea seems to me clear, and is implicit in, and consonant with, Heraclitus’ pervasive antinomic ontology. It is also of interest that the seventh-century theologian Maximus the Confessor wrote: ‘When nature has come to exist in God through the essential unity of him in whom it was created, it will possess an *ever-moving stability* and a *stable and changeless form of movement* generated eternally round that which is one, unique and always the same. It has been said that this state is a direct and permanent grounding in the first cause of created beings’ (Maximus, ‘Various texts on theology, the divine economy, and virtue and vice: fifth century’: 1990–2020, vol 2, Part III, §48).

58 *ibid* (149). Cf Schelling 1799b (11: emphasis in original): ‘The chief problem in the philosophy of Nature is not to explain what is *active* in Nature (for that, being her primary condition, is easily understood), but rather that which is *static* and *permanent*. The explanation however lies within that very condition – that whatever is permanent is for Nature the limit-point of her activity. For, given this, Nature restlessly strives against every limitation’ – » *Das Hauptproblem der Naturphilosophie ist nicht, das Thätige in der Natur, (denn das ist ihr sehr begreiflich, weil es ihre erste Voraussetzung ist), sondern das Ruhende, Permanente zu erklären. Zu dieser Erklärung aber gelangt sie eben durch jene Voraussetzung, daß das Permanente für die Natur eine Schranke ihrer eignen Thätigkeit sey. Denn, wenn dies ist, so wird die rastlose Natur gegen jede Schranke ankämpfen* «.

59 Nicholson 2018 (148).

- [151](#) JS Haldane 1917 (14: emphasis added).
- [152](#) For instance, Tseng & Levin (2013) report that ‘bioelectric cues function alongside chemical gradients, transcriptional networks, and haptic/tensile cues as part of the morphogenetic field that orchestrates individual cell behavior into large-scale anatomical pattern formation’. This is a rough description of the small part we observe to happen, but it doesn’t seem to me to get us closer to an explanation of what a morphogenetic field is, or where it is. I don’t have an answer, either, of course;

so my target is neither the positing of a morphogenetic field in the first place, which seems an intelligent hypothesis, nor the failure to provide an explanation of where or what it is, but rather the implication that one's favoured mechanism provides even a partial answer. See also Levin 2012; and Burr & Northrop 1935.

175 Edwards 1993 (40: emphasis in original). There is a strong correlation between a bud’s closeness to the ideal form – whether measured by closest fit to the perfect mathematical curve-form, or simply as the mean of all examples – and the amount of sap in the bud, as an index of its vitality (203ff). Did the level of vitality dictate the form, or the form dictate the level of vitality? ‘We have here two possible ways of looking at the world. One sees form as a necessary adjunct of matter. The substance is there, therefore it must have a form of some sort or another. The form is there because of the substance. The other sees form as the primary reality, which can only then become visible to our eyes when it takes up substance and moulds it to its purpose. The substance is there because of the form’ (209). I imagine it could be both: an accident of form, due to say wind or weather, is therefore inhibited in vitality, which means that in turn it is less open to being moulded in the form to which it should go – and vice versa.

176 Weiss 1971.

[177](#) Webster & Goodwin 2011 (87 & 240); Leiserson, Bonini & Benzer 1994. I readily acknowledge that there are other mechanisms involved in the production of eyes, in which several genes interact (Iyer, Singh, Jensen *et al* 2018; McCammon, Blaker-Lee, Chen *et al* 2017). What remains of interest is that the whole senses that the parts need to change in order that a certain apparently foreseen outcome should be achieved for the whole, despite the normal mechanism's failure. Merely showing that a different mechanism comes into play does not address this issue.

[187](#) Taylor, Mulley, Dills *et al* 2015. The paper is cited by Noble (2017), who continues: 'Specifically, Taylor *et al* show that deletion of FleQ (Flagellar transcriptional regulator) in *Pseudomonas fluorescens*, and starvation of the bacteria, produces mutations that enable the regulatory role to be taken over by *a different pathway, normally involved in nitrogen uptake and assimilation. The genes required to produce flagella are then reactivated by the new regulatory pathway.* The authors interpret their work as showing how selection can rapidly produce this kind of substitution to restore activation of flagella genes. But, equally clearly, the mutations are targeted in a remarkably precise way. They are not randomly occurring anywhere in the genome' (emphasis added).

214 Petersen 1963.

215 Oliver 2019. A comment by philosopher of science Nancy Cartwright reflects her perception of a common structure to freedom in society and physics: ‘I imagine that natural objects are much like people in societies. Their behaviour is constrained by some specific laws and by a handful of general principles, but it is not determined in detail, even statistically. What happens on most occasions is dictated by no law at all’ Cartwright 1983 (49). For further discussion of determinism, in relation to matter and consciousness, see Chapter 25.

216 Bohm 1989.

217 von Bertalanffy 1933 (38).

218 In the introduction to J Scott Turner’s fascinating book *The Tinkerer’s Apprentice*, in which he dares to question the sufficiency of purely mechanical explanations, one senses his apprehension. Describing his book as not intentionally provocative, but nonetheless almost certain to irritate throughout, he writes: ‘The irritation culminates in the fourth stage, which is also the last chapter, where I bring the discussion back to what place design might have in a comprehensive theory of evolution. If you have not thrown the book against the wall already, perhaps this is the chapter that will make you do it’ (Turner 2007, 3). Is that the best he should be able to expect of his scientific colleagues? Would such a remark be expected in any other scientific context than the profoundly conservative life sciences?

219 One reason they may dislike such an attribution is that, that way, the ‘divine’ qualities are no longer available to be applied – in some cases, no doubt, unconsciously – to themselves. Some of it is quite explicit. The title of Mark Lynas’s popular book *The God Species* refers to ourselves.

221 Talbott 2010b (27).

222 Simpson 1963 (emphasis added).

223 Quoted in Mayr 1976 (392). A similar formulation is also attributed to the German physiologist Ernst Wilhelm von Brücke (see Cannon 1945, 108).

224 Mayr 1989 (55).

225 Monod 1977 (20). I cannot find a source for ‘nature does not have any intention or goal’. It is the quote from Monod most widely repeated across the internet: the sources are always unknown or non-existent. It may be a case of an unfounded ‘truth’ becoming ‘real’ through simple repetition. Claims are made (eg, on the Wikipedia page for Monod, though it gives no page reference and I suspect may not have been fully researched) that it might come from *Chance and Necessity*, a book I first read in my teens. However, I cannot find it there. Tellingly, it is not included, despite its currency, on Monod’s Wikiquote page. I welcome any hints from readers.

- 232** Weiss 1962.
- 233** Dobzhansky 1975. For an overview of this question, see Talbott 2011b: 'Organism-environment relations present us with so much complexity, so many possible parameters to track, that, apart from obviously disabling cases, there is no way to pronounce on *the* significance of a mutation for an organism, let alone for a population or for the future of the species ... If reduced fitness can be on the path toward higher fitness, and if the environment for which the organism is supposed to be fit is itself a modifier of the organism's fitness, then to what solid and stable ground do we anchor our idea of fitness?' Indeed biologists and philosophers, as Talbott points out, have yet to provide an adequate interpretation of fitness (Millstein & Skipper 2007); 'no concept in evolutionary biology has been more confusing' than that of fitness (Ariew & Lewontin 2004). 'Yet the neo-Darwinian theory of natural selection hinges, in its "status ... as empirical science," upon a reasonable understanding of what fitness means (Bouchard & Rosenberg 2004) ... Not only do we have great difficulty locating meaningless chance in the context of the actual life of organisms; it now turns out that the one outcome with respect to which randomness of mutation is supposed to obtain – namely, the organism's fitness – cannot be given any definite or agreed-upon meaning, let alone one that is testable' (Talbott *op cit*, 46–52).

138 Taleb 2013.

139 Since the evidence presented in this book is not by any means the whole evidence I have considered, what I say should be taken as referring to the body of evidence presented in both *The Master and his Emissary* and in this present volume.

140 The phrase is usually quoted in the mediaeval Latin form: *Amicus Plato, sed magis amica veritas*. There is an approximation to this sentiment, which does not mention Plato by name, in Aristotle’s *Nicomachean Ethics* (1096a11–15), but the closest wording is to be found in the work of the thirteenth-century philosopher, Roger Bacon (*Opus majus*, I, v): ‘*Plato dicit, Amicus est Socrates, magister meus, sed magis est amica veritas. Et Aristotelis dicit se magis velle consentire veritati, quam amicitiae Platonis, doctoris nostri.*’

- 58** Cottingham 2009. Cf the philosopher Hans Vaihinger 1935 (7): ‘The organic function of thought is carried on for the most part *unconsciously*. Should the product finally enter consciousness also, or should consciousness momentarily accompany the processes of logical thought, this light only penetrates to the shallows, and the actual fundamental processes are carried on in the darkness of the unconscious. The specifically purposeful operations are chiefly, and in any case at the beginning,

wholly instinctive and unconscious, even if they later press forward into the luminous circle of consciousness'. Cf also the philosopher Miguel Unamuno 1954 (2): 'In most of the histories of philosophy that I know, philosophic systems are presented to us as if growing out of one another spontaneously, and their authors, the philosophers, appear only as mere pretexts. The inner biography of the philosophers, of the men who philosophised, occupies only a secondary place. And yet it is precisely this inner biography that explains for us most things.'

59 Cottingham *op cit* (emphasis in original).

60 Eddington 1939 (129).

61 Leibniz 1999 (913): '[*Quo facto*] *quando orientur controversiae, non magis disputatione opus erit inter duos philosophos, quam inter duos Computistas. Sufficiet enim calamos in manus sumere sedereque ad abacos, et sibi mutuo (accito si placet amico) dicere: calculemus*'.

62 Pascal 1976, §253 (Lafuma §183): « 2 excès: exclure la raison, n'admettre que la raison ».

- 50** Burke 1887, vol 1 (137).
- 51** Pascal 1976, §1 (Lafuma §512): « *Ce qui fait donc que certains esprits fins ne sont pas géomètres, c’est qu’ils ne peuvent du tout se tourner vers les principes de Géométrie: mais ce qui fait que des géomètres ne sont pas fins, c’est qu’ils ne voient pas ce qui est devant eux, et qu’étant accoutumés aux principes nets et grossiers de Géométrie, et à ne raisonner qu’après avoir bien vu et manié leurs principes, ils se perdent dans les choses de finesse, où les principes ne se laissent pas ainsi manier. On les voit à peine: on les sent plutôt qu’on ne les voit: on a des peines infinies à les faire sentir à ceux qui ne les sentent pas d’eux-mêmes: ce sont choses tellement délicates et si nombreuses, qu’il faut un sens bien délicat et bien net pour les sentir, et sans pouvoir le plus souvent les démontrer par ordre comme en Géométrie, parce qu’on n’en possède pas ainsi les principes, et que ce serait une chose infinie de l’entreprendre. Il faut tout d’un coup voir la chose d’un seul regard, et non par progrès de raisonnement, au moins jusqu’à un certain degré. Et ainsi il est rare que les géomètres soient fins, et que les fins soient géomètres; à cause que les géomètres veulent traiter géométriquement les choses fines, et se rendent ridicules, voulant commencer par les définitions, et ensuite par les principes, ce qui n’est pas la manière d’agir en cette sorte de raisonnement. Ce n’est pas que l’esprit ne le fasse; mais il le fait tacitement, naturellement, et sans art; car l’expression en passe tous les hommes, et le sentiment n’en appartient qu’à peu* ».
- 52** Scruton 1997 (152).

- 53** Lévi-Strauss 1955 (138: emphasis added): « *l'œuvre du peintre, du poète ou du musicien, les mythes et les symboles du sauvage doivent nous apparaître, sinon comme une forme supérieure de connaissance, au moins comme la plus fondamentale, la seule véritablement commune, et dont la pensée scientifique constitue seulement la pointe acérée : plus pénétrante parce qu'aiguillée sur la pierre des faits, mais au prix d'une perte de substance ...* ».

- 90** The golden ratio, presenting no obvious mechanism for its explanation, has attracted sceptics as well as advocates, despite a history going back to Egypt, Greece and Rome. The most thorough and even-handed review I know is that by Christopher Green (Green 1995), in which he concludes: ‘I do not think it unreasonable to suggest that there has been a tendency among many psychologists to discount the golden section *a priori* as a “numerological fantasy”. I also think that it is clear, particularly in the tone of their writing, that doing away with this “fantasy” has been the guiding intent of many of them. Consequently, many of the studies have been carried out crudely, some even sloppily, rather than with a desire to “tease out” what might be a somewhat fragile, but nonetheless consistent, effect ... I am led to the judgment that the traditional aesthetic effects of the golden section may well be real, but that if they are, they are fragile as well. Repeated efforts to show them to be illusory have, in many instances, been followed up by efforts that have restored them, even when taking the latest round of criticism into account.’ For the ubiquity of ϕ in nature, see also a recent review by Iosa, Morone & Paolucci 2018. Also further discussion in Chapters 24 & 26.

- 125** Bradley 1897 (xii).
- 126** Cornford 1912 (138), cited in Black 1983 (15). James’s friend and colleague FCS Schiller took a similar view: ‘Actually every philosophy was the offspring, the legitimate offspring, of an idiosyncrasy, and the history and psychology of its author had far more to do with its development than *der Gang der Sache selbst* [progression of the topic itself] ... The naïve student insists on viewing the system from the outside, as a logical structure, and not as a psychological process extending over a lifetime. And he thereby throws away, or loses, the key to understanding’ (Schiller 1933, 10–11).
- 127** Kay 2012. The quote from Franklin, which in the original runs ‘So convenient a thing it is to be a *reasonable creature*, since it enables one to find or make a reason for everything one has a mind to do’, comes from his *Autobiography* (1996, 27: emphasis in original).

- 131** Dewey 1931 (215).
- 132** Wittgenstein 1984 (20e): ‘It is sometimes said that a man’s philosophy is a matter of temperament, and there is something in this. A preference for certain similes could be called a matter of temperament and it underlies far more disagreements than you might think’.
- 133** James 1960 (17–20): ‘The philosophy which is so important in each of us is not a technical matter; it is our more or less dumb sense of what life honestly means. It is only partly got from books; it is our individual way of just seeing and feeling the total push and pressure of the cosmos ... The history of philosophy is to a great extent that of a certain clash of human temperaments ... Of whatever temperament a professional philosopher is, he tries, when philosophising, to sink the fact of

his temperament. Temperament is no conventionally recognised reason, so he urges impersonal reasons only for his conclusions. Yet his temperament really gives him a stronger bias than any of his more strictly objective premises. It loads the evidence for him one way or the other ... There arises thus a certain insincerity in our philosophic discussions: the potentest of all our premises is never mentioned.'

134 Nietzsche 1994 §513 (238). Cf 'The statements of a speculative philosopher do not directly express facts about the universe but symptomatically express facts about himself: they form his unconscious autobiography' (Wisdom 1947, 177).

135 Nietzsche 1974a §6.

136 Murdoch 1999 (359).

137 Letter of Jung to Arnold Künzli, 28 February 1943; in Jung 1973–6, vol 1 (331–2).

138 Monk 2019. He points to the narrowness, pugnacity and cut and dried style of what I call the 'triple A' (Anglo-American analytic) tradition, headed up by Gilbert Ryle, its repudiation of context and neglect of the broader humanities; and wonders what would have happened if the broadly based, humane, style of Collingwood, Ryle's predecessor in the Waynflete chair at Oxford, had been allowed to flourish: 'Given just how different he was from Ryle – deeply cultured, curious about everything, eclectic in his interests – the question of what course post-war philosophy in Britain might have taken if Collingwood had not succumbed to a series of strokes at this relatively early age [early 50s] must rank as one of the great "what ifs" of intellectual history. Might British philosophy have avoided becoming as narrow as it at one time did, and might it have engaged much more fruitfully with continental thinking?'

190 Joseph Jordania (2006) provides many strands of evidence that human choral singing was the central feature of pre-linguistic communication (see also McGilchrist 2009b, Chapter 3); that human choral singing helped create the rhythmic flow of language; that choral singing was one of the main communication mediums for the social cohesion and bonding of early human communities, before the development of articulated speech; and that ‘after the change of the communication medium from singing into articulated speech, choral singing lost its direct survival value, has been gradually marginalized, and started disappearing over the centuries and millennia. Multiple examples of the gradual disappearance of traditions of polyphonic singing in different cultures support this supposition’ (14). Jordania also claims that ‘the universally accepted idea of the natural evolutionary transformation of monophonic singing into polyphonic singing is a fiction, totally unsupported by the evidence’ (209). Polyphony, he argues, is primary.

This has been much discussed and even criticised by my English-speaking colleagues, because their feeling is that, from an empirical point of view, it is an utterly meaningless sentence. But for me it describes a lived experience, because it says exactly how I perceive my own relationship to my work. That is, my work gets thought in me unbeknown to me.’ For what it is worth, I have precisely the same experience.

- 23 Yehuda, Daskalakis, Bierer *et al* 2015. An interesting twist is that the analysis revealed that both Holocaust survivors and their offspring show epigenetic changes at the same site of FKBP5 intron 7, but in the opposite direction: Holocaust survivors had 10% higher methylation than control parents, whereas Holocaust offspring had 7.7% *lower* methylation than control offspring. One possible

interpretation is that the effect may be to make offspring more resilient, rather than more vulnerable. But the clinical data are not sufficiently clear on this to be decisive.

24 Dias & Ressler 2014.

25 On transplant causing changes of personality, reports are no doubt at times attributable to the patient discovering a new lease of life following surgery, or are simply imagined, though there are a number of anecdotes of sudden dramatic changes in, for example, musical and food tastes towards those of the donor which are harder to explain. One study describes 10 striking cases in which there were changes in tastes in food, music, art, sexual, recreational, and career preferences in line with those of the donor, as well as specific instances of perceptions of names and sensory experiences related to the donors (Pearsall, Schwartz & Russek 2002). There are a number of possible mechanisms that have been proposed, including cellular memory, but there is always an explanatory gap in going from cell proteins to reliable changes of phenomenology (Liestner 2020). The topic does not lend itself to research because tastes are not measurable, and confidentiality means that patients often do not know the identity, let alone the characteristics, of the donor. However, I am told by staff at Papworth Hospital (home to the first successful heart transplant in the UK) that a senior surgeon there, who was experienced in heart transplant operations, ceased to operate after becoming unnerved by the personality changes in the recipients.

47 Bechara, Damasio, Tranel *et al* 1997. Interestingly, from an evolutionary psychology point of view, women take longer to work out the long-term advantageous deck in the IOWA GT: 'Our review suggests that women focus on both win-loss frequencies and long-term pay-off of decks, while men focus on long-term pay-off. Furthermore, women may be more sensitive to occasional losses in the long-term advantageous decks than men. As a consequence hereof, women need 40–60 trials in

addition before they reach the same level of performance as men' (van den Bos, Homberg & de Visser 2013). This is yet another indication that men tend to emphasise the bigger picture more than women.

Although the authors seem to think that the decision, being concurrent with conscious information acquisition, must itself be conscious, this does not follow. Just because we are conscious of acquiring information doesn't mean we have to be conscious of the decision-making process going on at the same time – in fact, the opposite is more probable. (Oddly, those who hold this position also contrive to use the absence of any need for processing time as an argument in favour of conscious, rather than unconscious, processing.) The area is controversial; see, eg, González-Vallejo, Lassiter, Bellezza *et al* 2008. But much of the controversy here seems to me to hang on the unhelpful assumption that *either* decisions are made by information retrieved from long-term memory, *or* they are made at the very moment of information acquisition (so-called 'on-line'), our decisions being weighted by unconscious affective factors. These are not, however, mutually exclusive possibilities, and not even a true dichotomy. They may indeed be aspects of the same process which are each present to varying degrees in different situations; see, eg, Kim & Garrett 2012.

81 Whitehead 1929b (52–3).

82 O'Mahony 2014: 'According to his son, Robert, Soros's trading was always influenced by more than reflexivity. "My father will sit down and give you theories to explain why he does this or that", he once said, "but I remember seeing it as a kid and thinking, 'Jesus Christ, at least half of this is bullshit'. I mean, you know the reason he changes his position on the market or whatever is because his back starts killing him. It has nothing to do with reason. He literally goes into a spasm and it's this early warning sign." Soros Snr has admitted to relying greatly on "animal instincts", saying the onset of acute pain was often "a signal that there was something wrong in my portfolio".'

140 See, eg, Grover, Sahoo & Surendran 2018; Tonna, Ottoni, Paglia *et al* 2016. The preservation of common sense, on the other hand, differentiates affective disorders from schizophrenia: ‘in any case, the preserving of this ability in cyclothymic patients is an important criterion for differential diagnosis with schizophrenic patients’: Blankenburg 2001 (305). Blankenburg is arguing not that people with depression or mania always behave in common sense ways or that their beliefs are commonsensical – hardly. What he is suggesting is that the deep intuitive bridge to the shared world is preserved, even if temporarily lost sight of at the peaks of illness.

During the sleep onset period, all EEG bands, except beta, reverse, so as to predominate in the right hemisphere (Boldyreva & Zhavoronkova 1991; Zhavoronkova & Trofimova 1997, 1998). A right hemisphere superiority upon awakening from REM sleep has also been confirmed in behavioural studies, as well as evidence that the left hemisphere falls asleep first (see Gordon, Frooman & Lavie 1982; Bertini, Violani, Zoccolotti *et al* 1984; Casagrande, Violani, De Gennaro *et al* 1995). But the evidence on hemisphere predominance during dreaming, as such, is less clear-cut, with studies favouring either hemisphere, or neither.

76 Coleridge 1817. All allusions and reference in this paragraph are from vol I, 295–6, & vol II, 12.

77 Coleridge 1817. All allusions in this paragraph are from vol II, 12.

78 Coleridge 1817, vol I (295–6: emphasis in original).

79 Coleridge 1962, §3158. In this entry Coleridge gives a trenchant rebuttal of philosophy in the absence of imagination: 'Form is factitious *Being*, and Thinking is the Process. Imagination the Laboratory, in which Thought elaborates Essence into Existence. A Psilosopher [*sic*], i.e. a nominal Ph. without Imagination, is a Coiner—Vanity, the *Froth* of the molten Mass, is his *Stuff*—and Verbiage the Stamp & Impression. This is but a *deaf* Metaphor—better say, that he is guilty of Forgery—he presents the same (sort of) *Paper* as the honest Barterer, but when you carry it to the *Bank*, it is found to be drawn on—Outis, *Esqre*. His Words had deposited no Forms there, payable at Sight—or even at any imaginable Time from the Date of the Draft/'. Outis (Οὔτις) is Greek for 'nobody'.

80 Coleridge 1985: notes to 168–69.

81 Coleridge 1817, vol II (11–12).

82 Coleridge 1817, vol II (6).

83 'With what must science begin?' in Hegel 1969, vol I, Bk I, §112: » ...[*die*] *Einheit des Unterschieden- und des Nichtunterschiedenseyns, – oder [die] Identität der Identität und Nichtidentität.* «

84 Schelling 1830 (98): » *Ohne intellektuelle Anschauung keine Philosophie!* «

85 Gare 2011.

86 Bergson 2007c (160).

87 Bergson 2007b (24).

88 The root is *g'n: cf Greek γινώσκειν/γίγνεσθαι. See Ronchi 2014 (xv). Ernout & Meillet 2001 (446): *Cognoscere: la racine signifiant « connaître » est, en indo-européen, homonyme de celle signifiant « naître, engendrer »*. This is a disputed area, and I cannot claim expertise here.

89 Quoted in Buhner 2014, epigraph to Chapter 2 (thanks to Nicholas Colloff).

90 Chargaff 1978 (109).

91 Coleridge 1957, §383 & §1016.

92 Chargaff *op cit* (111–2). Cf Thoreau's reported observation that candlelight illuminates darkness, while electricity kills it.

93 Feynman 1992 (127–8).

CODA TO PART II

1 The reader may remember that the right hemisphere is better at internal visualisation during the insight phase of a creative task. This not in any way in conflict with its generally being more attentive to and perceptive of the external world, as explained at length in Part I of this book.

2 Donne, 'Satyre III'.

APPENDIX 1

1 Some techniques may offer help in localisation (see, eg, Spyrou & Sanei 2008), but generally ERPs are highly reliable for temporal, but highly unreliable for spatial, localisation.

2 Woodman 2010: for further insights into these problems see Luck 2005; and Handy 2004.

12 Jaušovec & Jaušovec 2000a.

13 Razumnikova 2000. Importantly this researcher, who is also the only one to find creativity more linked to the left hemisphere, oddly found that '*convergent* thinking induced coherence increases ... that were more caudal [posterior] and right-sided'.

14 Fink, Graif & Neubauer 2009.

15 Martindale, Hines, Mitchell *et al* 1984.

16 Razumnikova 2004a.

17 Grabner, Fink & Neubauer 2007.

18 Fink, Grabner, Benedek *et al* 2009. I am most grateful to Andreas Fink for his clarification on this point. The abstract, which runs to almost 200 words, mentions the left hemisphere, but has nothing whatever to say about the right. Considering the clarity and significance of the finding about the right hemisphere and originality in a paper entitled 'The creative brain', I wondered for a moment if I had misunderstood the data, and so emailed the first author, Andreas Fink. He very graciously, and promptly, responded that I was 'perfectly right, more highly original subjects showed stronger alpha power increases at right posterior cortical sites (centrotemporal to parietooccipital)', and that they had commented 'briefly' on the matter in the body of their paper – as indeed they had.

30 Kiefer, Weisbrod, Kern *et al* 1998; Seger, Desmond, Glover *et al* 2000.

31 Atchley, Keeney & Burgess 1999; Bekhtereva, Starchenko, Klyucharev *et al* 2000; Carlsson, Wendt & Risberg 2000.

32 Bowden & Beeman 2003; Jung-Beeman, Bowden, Haberman *et al* 2004; Martindale, Hines, Mitchell *et al* 1984; Miller & Tippett 1996; Razumnikova 2004a.

33 On that point, as a side issue, after 'quantitative assessment' of the way in which 405 people solved problems, Carol Aldous proposed that creative thinking involved three processes: the interaction between visual-spatial and analytical-verbal reasoning; the interaction between conscious and non-conscious reasoning; and listening to the 'self' (CR Aldous 2007). What these may all indicate is permitting the right hemisphere to be heard. Normally analytical-verbal reasoning overshadows visual-spatial reasoning, and conscious processes overshadow unconscious ones; so 'interaction' might simply amount to not having a conscious, analytical-verbal monopoly, which is what effectively happens when the left hemisphere is 'in charge'. And listening to the 'self' boils down to attending to intuition, which is very largely right hemisphere-dependent, as we will see in Chapter 17.

34 Howard-Jones, Blakemore, Samuel *et al* 2005 (emphasis added).

35 See, for example, Beeman 1998; Beeman, Friedman, Grafman *et al* 1994.

49 Fink, Grabner, Benedek *et al* 2009

50 The authors write: ‘However, to our knowledge there is no direct evidence that it is especially the right-hemispheric *temporo-parietal* regions that need to be strongly activated during creative idea generation. As outlined above, rather the contrary seems to hold true. Also, in the recent fMRI study by Howard-Jones *et al* (2005) no evidence of increased right-hemispheric *temporo-parietal* activity during creative thinking was observed. They instructed participants to generate either creative or uncreative stories and found that creative (as compared to uncreative) story generation was associated with stronger bilateral frontal and *right middle occipital* activation but lower activity in the right inferior parietal lobe near the angular gyrus’ (emphasis added). In other words the argument is not about whether the right hemisphere as a whole is involved in creativity, but about which part. However, if they did not know of evidence for right temporoparietal activation during creative idea generation, they must have overlooked several imaging and EEG studies of insight and creative thinking which show just such an association: Schneider, Gur, Alavi *et al* 1996; Luo & Niki 2003; Dan’ko, Starchenko & Bechtereva 2003; Jung-Beeman, Bowden, Haberman *et al* 2004; and Chávez, Graff-Guerrero, García-Reyna *et al* 2004. They could not have known, of course, that subsequent research would find further evidence of right temporoparietal involvement: Benedek, Bergner, Könen 2011; Chi & Snyder 2011; Chi & Snyder 2012; and Kounios & Beeman 2014.

33 Later it transpired that the policy statements were shaped by a number of influential abstinence campaigners. Four key figures behind the government guidance, including Professor Gerard Hastings, who admits having omitted to declare his links, were either members of, or closely involved with, the so-called 'Institute of Alcohol Studies' (IAS), a lobby group financed by the temperance movement. This impressively titled institute is a subsidiary company and trading arm of the Alliance House Foundation, which, until it changed its name in 2003, was known as 'The UK Temperance Alliance', having started life in 1853 as the 'United Kingdom Alliance for the Suppression of the Traffic in all Intoxicating Liquors', and whose purpose, as described in its annual return to Companies House, is to 'spread the principles of total abstinence from alcoholic drinks'. *The Times* reported information from a confidential source with close knowledge of the meetings that had taken place over a period of years, as well as sources who were 'concerned at the tone and nature of some of the discussions they witnessed'. Apparently the IAS was more heavily represented on the committees drawing up the guidelines than any other body (information in this note is from a ruling of the Independent Press Standards Organisation (04923-16 *Brown v The Times*), after a complaint by one of the lobbyists was found to be unsubstantiated: www.ipso.co.uk/rulings-and-resolution-statements/ruling/?id=04923-16). As one Member of Parliament put it, 'that is not quite putting Dracula in charge of a blood bank, but it is not far off' (*House of Commons Hansard*, volume 612, entry for 28 June 2016, reporting Byron Davies, MP for Gower). 'The core funding for IAS comes from a separate educational charity called the Alliance House Foundation (no. 208554), of which IAS is a subsidiary company' (from the IAS's own website: www.ias.org.uk/Who-we-are.aspx). For the record, Professor Hastings is neither a scientist nor a doctor, but an expert on marketing, who has in the past successfully targeted the tobacco industry. A scientist with knowledge of the panel's workings told *The Times* newspaper there was a move afoot to 'demonise alcohol in the same way as cigarettes but without the justification' (*The Times*, 30 May 2016)

20. THE COINCIDENTIA OPPOSITORUM

1 Peirce 1931–60, vol 1, §457.

2 As quoted in Delbrück 1986 (167). A similar formulation – ‘you can recognize a deep truth by the feature that its opposite is also a deep truth’ – is sometimes attributed to physicist Frank Wilczek, because he included it in an account of Bohr’s philosophy in his 2015 book *A Beautiful Question: Finding Nature’s Deep Design*; but the context makes clear that he is (appreciatively) paraphrasing Bohr.

3 Hölderlin, *Hyperion*, ‘Hyperion an Bellarmin VIII’: » *Des Herzens Woge schäumte nicht so schön empor, und würde Geist, wenn nicht der alte stumme Fels, das Schicksal, ihr entgegenstände.* «

4 This account is derived from a landmark of Onondaga literature, dictated in 1900 by the Onondaga orator and priest, John Arthur Gibson, to his collaborator, JNB Hewitt, who was gathering material for his *Iroquoian Cosmology* (1903, 1928). In this passage I am relying on a substantial report of the myth contained in Needleman 2003 (204–12), who in turn was dependent on Hewitt: all quotations here are verbatim from Needleman, including any emphasis. I am grateful to Robert Bringhurst for helping me understand the provenance of this account. Bringhurst points out that the names of the two brothers in current Onondaga orthography would be Tháęhya.wá?gih and Ohá.æ?. I am also grateful to the anthropologist Stefano Fait, who noticed ‘a number of impressive parallels’ between the story and the structure of our brains, for bringing this remarkable passage to my attention.

5 Needleman 2003 (204).

6 Nietzsche 1962 (68). Heraclitus was, according to Karl Popper, ‘a thinker of unsurpassed power and originality’ (1994, 16).

7 Heraclitus fr LXXVIII [Diels 51, Marcovich 27] (trans C Kahn).

8 The usual word in Attic Greek is ἁρμονία (*harmonia*); Heraclitus uses the Ionic form ἁρμονίη (*harmonīē*). I have followed Kahn’s preference for Heraclitus’ usage, as I have in his preference for Heraclitus’ Ionic σύλλαψις (*syllapsis*) over the Attic σύλληψις (*syllēpsis*).

9 Kahn 1979 (196–200).

10 Heraclitus fr CXXIV [Diels 10, Marcovich 25] (trans C Kahn).

11 Heraclitus fr LI [Diels 91, Marcovich 40c3] (trans C Kahn).

12 Piazza, Lummen, Quiñonez *et al* 2015. Experiment shows an ensemble that has simultaneous wave-like and particle-like properties, but no specific particle was observed to behave as a particle and wave at the same time. But then the concept of a specific particle maybe simplistic: see Hut [undated].

13 It is also what Kriti Sharma noticed about the interdependent nature of living organisms, both with one another and their environment: they and their environment are *simultaneously* constituted, not by a process of sequent alternation.

14 Hugo, Preface to *Cromwell*, §60.

15 Empson 1949 (xiii).

16 Cited at Simpson 1948 (316).

17 For a perfect example of what I mean, see Carnap 1931.

18 But a self-sacrificing God is a universal insight, and is most familiar in the Christian *mythos*.

19 Hegel 1969, §187 (emphasis in original).

20 Watts 1989 (35).

21 *Upanishads*, trans S Radhakrishnan, 1953 (27): *Brihad-aranyaka*, iv, §4, 22 (emphasis added). Such boundaries are well-imaged by the ear drum, which separates inner from outer ear, but also connects them: its purpose is transmission of sound, and without it, the sound would not only not be transmitted, but could not arise. See Cilliers 2008 (48).

22 Hegel 1975, Part I, §48 (emphasis added).

23 Throughout this passage, the 1874 edition had used the word ‘contrary’ for ‘opposite’ (*entgegengesetzt*). The revision made in 1892 seems to me preferable.

24 Schleiermacher 1994 (3–5). NB: this, the standard English translation, is taken from the third edition of Schleiermacher’s text of 1831; this passage does not exist in quite this form in the 1799 edition.

25 Pascal 1976, §384 (Lafuma §177) : « *Contradiction est une mauvaise marque de vérité. Plusieurs choses certaines sont contredites. Plusieurs fausses passent sans contradiction. Ni la contradiction n’est marque de fausseté ni l’incontradiction n’est marque de vérité* » – ‘Contradiction is a poor criterion of truth. Many things that are certain are contradicted; many things that are false pass without contradiction. Contradiction is not a sign of falsehood, nor the lack of contradiction a sign of truth.’

26 Equally Abelard, in the twelfth century, wrote a treatise called *Sic et Non*, which means literally ‘Yes and No’, in which he set out 158 propositions from theology which could be logically argued for or against. It is thought to have been intended to train students in logic.

27 Quoted in Florensky 2004, where the phrase *vpolne zakonomerniye* is translated as ‘orderly’. I have substituted the more literal translation.

28 Bergson 1912 (39–40; emphasis added).

29 Whitehead 1954 (19).

30 Suzuki 1999 (66).

31 Whitehead, as reported by his wife, Evelyn Wade, in Whitehead 1954 (19).

32 Kazin 2011 (217): entry for 2 June 1957 (emphases in original).

33 Needleman 2016 (20).

34 An example of the first might be the Hindu philosophy of Sāṅkhāra; of the second, the biblical and Islamic doctrines of the transcendence of God: see Cousins 1978 (20).

35 » *Die gerade Linie führt zum Untergang der Menschheit* « (from the 1954 catalogue of his first exhibition in Paris at the studio of Paul Facchetti, written in December 1953).

36 Hundertwasser 1985.

37 Empedocles, fr DK31: B 17.9–13.

38 Schelling 1806 (56): » ... *ihr wahres Wesen erkennst du allein in dem Band, kraft dessen sie ihre Einheit ewig als die Vielheit ihrer Dinge, und hinwiederum diese Vielheit als ihre Einheit setzt. Du stellst dir auch nicht vor, daß es außer dieser Unendlichkeit von Dingen, die in ihr befindlich sind, noch eine andere Erde gebe, welche die Einheit dieser Dinge ist, sondern dasselbe was die Vielheit ist, dasselbe ist auch die Einheit, und was die Einheit ist, dasselbe ist auch die Vielheit, und dieses notwendige und unauslöslche Eins der Einheit und Vielheit selbst in ihr nennst du ihre Existenz ... Existenz ist das Band eines Wesens als Eines mit ihm selbst als einem Vielem.* « (emphasis in original).

39 In this paragraph I draw on a private communication from Eric Kaplan, to whom I am grateful.

73 Curie 1894 (400–1: emphasis in penultimate sentence in original): « ... *certains éléments de symétrie peuvent coexister avec certains phénomènes, mais ils ne sont pas nécessaires. Ce qui est nécessaire, c'est que certains éléments de symétrie n'existent pas. C'est la dissymétrie qui crée le phénomène ... les effets produits peuvent être plus symétriques que les causes.* »

74 For a penetrating insight into this logical 'paradox' in relation to the nature of Christ, see McCosker 2008 (esp 211).

75 This is a humorous retelling of a combination of two Talmudic passages (each only slightly different from the other). The original sources are from the Gittin and Eruvin, two volumes within the Talmud. Apparently a story similar to this is told in the 1971 film, *Fiddler on the Roof*. I am grateful to the late Rabbi Jonathan Sacks for this information.

76 The e-book (2018) is available free under a Creative Commons licence at physical-spirituality.neocities.org.

77 That is certainly true of major civilisations. In at least some sustainable oral cultures, what gets passed down, stored, retained, includes myths with no fixed 'interpretation' — uncodifiable knowledge that is nevertheless essential for survival: knowledge that insists on developing, in the listener, the skill required for understanding it. (Thanks to Jan Zwicky.)

81 Jung 1953–79, vol 12, §186.

82 Goethe 1948–, vol 16 (199): *Farbenlehre*, §739: » *Das Geeinte zu entzweien, das Entzweite zu einigen, ist das Leben der Natur; dies ist die ewige Systole und Diastole, die ewige Synkrisis und Diakrisis, das Ein- und Ausatmen der Welt, in der wir leben, weben und sind.* «

83 In general the human heart beat, when it is in what is called sinus rhythm (that is to say, beating normally) is considerably variable, though regular: the interval between beats in any one sequence may vary from, say, around 0.85 to 1.35 beats per second. Loss of such variability is again a sign of stress and is not desirable. Note, this is quite distinct from an arrhythmia, which is normally undesirable, and in which the underlying regularity of beat structure is either temporarily or permanently lost.

84 I say 'more usually', because a melodic line also contains harmonies – ones that are not concurrent at a single moment.

92 Thompson 1992 (334).

93 This passage comes from a chapter called ‘The diviners by turtle shell and milfoil’, which was added to the *Historical Records (Shih chi)* after Ssu-ma Ch’ien’s death, by someone calling himself Mr Ch’u. It is a very early addition, however – probably of the first century BC. For the translation and an explanation of this passage I am indebted to the kindness of my erstwhile All Souls colleague, the consummate sinologist David Hawkes, who drew it to my attention, and encouraged – as many might not have done – my naïve interest in all things Chinese. I am told that Persian rugs also traditionally contain an imperfect stitch.

21. THE ONE AND THE MANY

1 Heraclitus fr XXXVI [Diels 50, Marcovich 26] (trans IMcG). The phrase is normally translated in the first sense, emphasising the unity of multiplicity: the Greek elegantly, and in the true spirit of Heraclitus, equally permits the second, emphasising the multiplicity of unity. And thus unifies division and union at a meta-level.

2 From a course description for Philosophy I in ‘Spring Bulletin’, *The New Yorker*, 29 April 1967 (37).

3 Muir 1875 (364). Nearly 200 years earlier, Leibniz wrote in a letter to Arnaud, dated September 1687: « *Toutes les substances sympathisent avec toutes les autres et reçoivent quelque changement proportionnel répondant au moindre changement qui arrive dans tout l’Univers ...* » – ‘every substance is in sympathy with every other, and is to some degree altered in response to the least change that occurs in the entire universe ...’.

4 Kolakowski 1985 (20).

5 Smolin 2013 (215).

6 Hopkins 1963.

7 I am greatly indebted to John Cutting for his insights here. The quote comes from a personal communication. He deals with this at greater length in a published article (2018).

8 According to Nicholas of Cusa, the greatest philosophical and scientific mind of the fifteenth century, ‘individual specimens are all that exist, but not only are they contracted images of God’s oneness, but also contracted images of their types insofar as each more or less fulfils the possibilities of its nature.’ This insight draws together the different levels of difference and sameness across the entire cosmos from the lowliest existing thing to God. See Miller 2017.

9 Hopkins *op cit* (103).

10 Wordsworth 1876, vol II (96).

11 Begbie 2008 (89–90).

12 James 1897, ‘The importance of individuals’: 255–62 (256–7).

13 Whitehead 1926a.

14 Heidegger, ‘Das Ge-stell’; in *Gesamtausgabe*, vol 79, 1994 (36); a still never officially translated lecture, here in the translation offered *en passant* in Levin 1999 (121).

15 James 1897, ‘The sentiment of rationality’: 63–110 (70: emphasis added). Bergson similarly thought that our ability to produce and understand generalities evolved purely for practical purposes, enabling us to classify our surroundings in such a way as to achieve maximum utility.

16 Da Ponte’s libretto for *Don Giovanni*, Act I, sc v.

17 Nietzsche 1970 (234).

18 Nietzsche 1967, §503 (emphasis in original in all quotations from Nietzsche on this page).

19 *ibid*, §515.

20 *ibid*, §499.

21 *ibid*, §501.

22 *ibid*, §510.

23 *ibid*, §511. *Geist* can mean ‘intellect’ or ‘spirit’; ‘intellect’ is here less confusing and I have accordingly substituted it.

24 Solzhenitsyn 1973 (33).

25 Whitehead 1933 (181: emphasis added).

26 Blake, *Jerusalem*, ch 3, Plate 55, lines 60–4.

27 Zwicky 2014b, §55.

28 Mu 2009 (45): ‘In sum, the *dao* is the ultimate source, unifying power, and fundamental principle of nature and the universe; it manifests itself through particular individual things’.

29 Zwicky 2014b, §53(a).

30 Hopkins 1963 (145–6).

31 *Hæcceitas* (variously, also, *hæccitas* or *hæceitas*) was the term used by the mediaeval philosopher and theologian Duns Scotus to denote the *principium individuationis*, or formal principle of individuation – that which, for example, makes you not just ‘a person’ but the unrepeatable person you are. Hopkins was greatly influenced by Duns Scotus (‘who of all men most sways my spirits to peace’), and invented the term ‘inscape’ to refer to the incarnate manifestations of this principle in the individual nature of every creature.

32 Blake, *The Marriage of Heaven and Hell*, Plate 24.

33 *ibid*, Plate 8, line 19.

34 Chief Sitting Bull 1883, quoted 1973 (see bibliography). There is a further layer of meaning: Sitting Bull was a Lakota Sioux, whose symbol is an eagle; and they and the Crow Indians were long-standing enemies. The Crow had sided with the US troops.

35 Collingwood 1983 (101).

36 McElroy & Stroh 2013.

37 Chatham, Claus, Kim *et al* 2012; Aron, Robbins & Poldrack 2014.

38 The distinction is important in Spinoza. For a discussion, see Antonio Negri who writes: ‘*potestas* refers to power in its fixed, institutional or “constituted form”, while *potentia* refers to power in its fluid, dynamic or “constitutive” form’ (2004, 15). In English, our words ‘potential’ and ‘power’ tend to conflate the meaning; by contrast, French (*puissance/pouvoir*) and Italian (*potenza/potere*) do not.

39 Heraclitus fr XL [Diels 90, Marcovich 54] (trans C Kahn).

40 Blake, *The Marriage of Heaven and Hell*, Plate 7, ‘Proverbs of Hell’; and letter to William Hayley, 6 May 1800.

41 Flourens 1948 (139).

42 A response to Edmond Malone’s comment, ‘generalising and classification is the great glory of the human mind’; in marginalia to Blake’s copy, now in the British Library, of *The Works of Sir Joshua Reynolds* in 3 vols, Cadell & Davies, London, 1798, vol 1: ‘An account of the life and writings of the author’, by Edmond Malone (xcviii).

43 In the film *The Life of Brian*, the Christ-figure, Brian, expostulates with a crowd of followers: ‘Look, you don’t need to follow me, you don’t need to follow anyone. You’re all different.’ In unison they reply: ‘Yes, we are *all different*’. ‘No, you don’t understand. You are *all individuals*.’ In unison they reply: ‘Yes, we are *all individuals*.’ Immediately after, one little bloke objects: ‘I’m not’.

- [34](#) Canales 2016a (64).
- [35](#) Canales *op cit*.
- [36](#) Canales 2016b (237–8). Amusingly, a zealous ‘editor’ of the Wikipedia entry for Eugène Minkowski has interpolated in italics the urgent warning: ‘his book “*Le Temps vécu*” (*Lived Time*) is closely linked to Bergson’s philosophy and his anti-scientific ideas, so all the book of Minkowski, including “psychopathological studies”, is in doubt.’ Even by Wikipedia standards this is prime tripe. First, there’s no way an association with Bergson could invalidate a lifetime’s careful observation of patients, even if Bergson was wrong about the nature of time, which in the opinion of many philosophers and physicists he was not. Second, Bergson is not anti-scientific in the least: it is hard to think of a philosopher of his age who had greater respect for, and interest in, physics and mathematics. Third, Minkowski was himself not in any way anti-scientific. And fourth, to support his anxious interpolation, the ‘editor’ refers to Canales’s book, page 215. Unfortunately the ‘Minkowski’ referred to there is the Russo-German mathematician Hermann Minkowski, nothing to do with the French psychiatrist; and in any case the whole tenor of Canales’s book is to challenge precisely this unreflective prejudice, and so presumably was not read by the ‘editor’ in question.

97 Capa, Duval, Blaison *et al* 2014. These findings are interesting, too, because it seems to me that failures to observe temporal order might give rise to misperceiving causal influences, a common problem in delusions. If you seem to experience the thought 'Beckham shoots for goal' not immediately after, as is normal, but at the same time as, or just before, Beckham shoots for goal, you may believe that you influence Beckham to score the goal – therefore that events can, apparently, be brought about by thinking them.

98 Events flow: Giersch, Poncelet, Capa *et al* 2015. Melody: a significant and specific impairment of melody appreciation is found in schizophrenia (Kantrowitz, Scaramello, Jakubovitz *et al* 2014).

110 Bergson 2007a (9).

111 Bergson 2007a (8 & 10).

112 See, eg, Eliot 1941 (25–626): ‘What happens when a new work of art is created is something that happens simultaneously to all the works of art that preceded it. The existing monuments form an ideal order among themselves, which is modified by the introduction of the new (the really new) work of art among them ... the relations, proportions, values of each work of art towards the whole are readjusted ... Whoever has approved this idea of order, of the form of European, of English literature will not find it preposterous that the past should be altered by the present as much as the present is directed by the past.’

113 Borges, ‘Kafka and his precursors’: 1964a (236: emphasis in original).

114 Bergson 2007a (12).

115 Bergson 2007e (113).

116 Bergson 2007e (110).

117 Smolin 2013 (48).

118 Bergson 2007f (77).

119 Ma, Herbst, Scheidl *et al* 2012; Yin, Cao, Yong *et al* 2013.

120 Robbins 2004 (783), referring to de Broglie 1969. This paragraph is based on my reading of Robbins, and at times follows approximately his wording.

121 Nottale 1996; Feynman & Hibbs 1965. Both cited in Robbins *op cit*.

122 Robbins *op cit* (783).

123 Bergson 1965 (116–7): « *De quel objet, extérieurement aperçu, peut-on dire qu’il se meut, de quel autre qu’il reste immobile? Poser une pareille question, c’est admettre que la discontinuité établie par le sens commun entre des objets indépendants les uns des autres, ayant chacun leur individualité, comparables à des espèces de personnes, est une distinction fondée. Dans l’hypothèse contraire, en effet, il ne s’agirait plus de savoir comment se produisent, dans telles parties déterminées de la matière, des changements de position, mais comment s’accomplit, dans le tout, un changement d’aspect, changement dont il nous resterait d’ailleurs à déterminer la nature.* » The standard translation by Paul and Palmer would appear to miss the meaning.

124 Bergson 1965 (117): « *Comment morcelons-nous la continuité primitivement aperçue de l’étendue matérielle en autant de corps, dont chacun aurait sa substance et son individualité? Sans doute cette continuité change d’aspect, d’un moment à l’autre : mais pourquoi ne constatons-nous pas purement et simplement que l’ensemble a changé, comme si l’on avait tourné un kaléidoscope? Pourquoi cherchons-nous enfin, dans la mobilité de l’ensemble, des pistes suivies par des corps en mouvement? Une continuité mouvante nous est donnée, où tout change et demeure à la fois : d’où vient que nous dissociions ces deux termes, permanence et changement, pour représenter la permanence par des corps et le changement par des mouvements homogènes dans l’espace? Ce n’est*

pas là une donnée de l'intuition immédiate ; mais ce n'est pas davantage une exigence de la science, car la science, au contraire, se propose de retrouver les articulations naturelles d'un univers que nous avons découpé artificiellement. » The standard translation by Paul & Palmer is obscure and clumsy: I have tried to provide something more natural and comprehensible.

125 Leibniz, letter to Antoine Arnauld, late November 1671.

126 Robbins 2004 (783).

127 Oreshkov, Costa & Brukner 2012.

- 180** Einstein, letter of March 1955, to Michele Besso's family following his death: 'People like us, who believe in physics, know that the distinction between past, present, and future is only a stubbornly persistent illusion' (quoted in Dyson 1979, 193). However, Einstein may be assumed to have been merely comforting the bereaved. According to Carnap: 'Once Einstein said that the problem of the Now worried him seriously. He explained that the experience of the Now means something special for man, something essentially different from the past and the future, but that this important difference does not and cannot occur within physics. That this experience cannot be grasped by science seemed to him a matter of painful but inevitable resignation' (Schilpp 1963, 37–8). On which, Smolin comments: 'Einstein's discontent comes down to a simple insight. A scientific theory, to be successful, must explain to us the observations we make of nature. Yet the most elemental observation we make is that nature is organised by time' (Smolin 2013, 91–2). We have choice about space, about where we move and the speed at which we do so, but not about time.

52 This is also in keeping with Pragmatism. Cf Rosenthal 1996: 'Pragmatic continuity can best be understood as having both unity and multiplicity' (559).

53 Schelling 1799a (30-1): » *Man denke sich einen Strom, derselbe ist reine Identität, wo er einem Widerstand begegnet, bildet sich ein Wirbel, dieser Wirbel ist nichts Feststehendes, sondern in jedem Augenblick Verschwindendes, in jedem Augenblick wieder Entstehendes. In der Natur ist ursprünglich nichts zu unterscheiden; noch sind gleichsam alle Producte aufgelöst und unsichtbar in der allgemeinen Productivität. Erst wenn die Hemmungspunkte gegeben sind, werden sie allmählich abgesetzt, und treten aus der allgemeinen Identität hervor. – An jedem solchen Punkt bricht sich der Strom (die Productivität wird vernichtet), aber in jedem Moment kommt eine neue Welle, welche die Sphäre erfüllt.* «

54 Schelling 2004, 'The unconditioned in nature': vol I, i (18: emphasis in original).

55 Schelling 1994 (116: emphasis in original).

56 Schelling 1799a (22): » *in der gemeinen Ansicht verschwindet [die ursprüngliche Productivität der Natur] über dem Product; in der philosophischen verschwindet umgekehrt das Product über der Productivität.* «

57 *ibid* (6): » *Philosophieren über die Natur heißt, sie aus dem toten Mechanismus, worinn sie befangen erscheint, herausheben, sie mit Freiheit gleichsam beleben und in eigne freie Entwicklung versetzen – heißt, mit andern Worten, sich selbst von der gemeinen Ansicht losreißen, welche in der Natur nur, was geschieht –höchstens das Handeln als Factum, nicht das Handeln selbst im Handeln – erblickt.* «

165 Schmahmann 2010. I mentioned that in patients with motoneurone disease, there are problems with retrieving verbs of action: there is activation in the right posterolateral and midline cerebellum, which can be visualised on brain imaging, when subjects are asked to generate verbs for nouns, a process conventionally believed to be confined to 'lexical processing areas' of the neocortex (Fiez & Raichle 1997). See Vigliocco, Vinson, Druks *et al* 2011, for a sensible and comprehensive review of the separate debate about whether nouns and verbs are processed independently in the brain.

5 Cf McGinn 1995, for whom consciousness ‘seems not to be the *kind of thing* that falls under spatial predicates. It falls under temporal predicates ...but it resists being cast as a regular inhabitant of the space we see around us and within which the material world has its existence’ (220: emphasis in original).

6 Scheler 2008 (300–1).

7 Whitehead 1938 (139–40).

8 See Chapter 12.

9 Schrödinger 1951 (21: emphasis in original).

10 Some of my thinking here was influenced by the work of the mycologist, Alan Rayner: see Rayner 2017. Incidentally, at first glance, this is the opposite of the way in which the origins of the world are expressed according to the creation myth in Genesis, where it is written that ‘the earth was without form, and void; and darkness was upon the face of the deep: and the Spirit of God moved upon the face of the waters.’ But what was real at that stage was the Spirit of God, and the world was merely a receptive space (‘void’) without any identity: it was the creative force of the Spirit of God that brought form to it, and thereby brought it into being. So for what it is worth, there seems to me to be no contradiction here.

- [42](#) The case of a Mexican artist has been reported in detail (Orjuela-Rojas, Sosa-Ortiz, Díaz-Victoria *et al* 2017). After resection of a neurocytoma that affected the right thalamo-parietal connexions, he suffered an impairment of the ability to create perspective in his paintings and omitted shapes only on the left side of his paintings. Before the procedure, his paintings evinced ‘a play of light and shadow’: he achieved the representation of a complex volume using different depths of shading, and suggesting a light source coming from the right side of the picture. For example, in a landscape painting ‘each shape is associated with a shadow that depends on the position of the light source. This is the case with the rock in the foreground, the house, and the mountains, creating not only three dimensionality but also giving credibility to the painting ... [After the procedure there was] no efficient perspective, the brush stroke is loose and imprecise, there are no figurative details (birds, trees, flowers, clouds) in the left space, but distribution of colour throughout the work remains. There is no strong light source; thus, the figures, including the tree that casts no shadow, lack volume ... The origin of light is ambiguous throughout the image, constantly *changing in an arbitrary way*’ (emphasis added). This is the difference between a real, unique, embodied view and a ‘view from nowhere’, which, as discussed both in this book and *The Master and his Emissary*, is remarkably like the view taken, both literally and metaphorically, by the left hemisphere.

107 Life is bound up with energy fields that emit light. ‘Organisms and tissues spontaneously emit measurable intensities of light, ie photons in the visible part of the electromagnetic spectrum (380–780 nm), in the range from 1 to 1,000 photons per second per square centimetre, depending on their condition and vitality. It is important not to confuse ultraweak photon emission from living systems with other biogenic light-emitting processes such as bioluminescence or chemiluminescence ... Ultraweak photon emission also supports the understanding of life sustaining processes as basically driven by electromagnetic fields’ (Schwabl & Klima 2005).

142 Brooks 2016. Fermions (one of the two basic classes of particles, which includes, among others, electrons, protons, neutrons, neutrinos and quarks) that spin in a counter-clockwise direction feel the weak nuclear force, and those that spin in a clockwise direction do not.

143 Tong 2012.

144 One mechanism for this is that neuronal receptors have built-in chirality, and when a drug is designed to 'lock on' to a receptor and activate it, the wrong enantiomer may block the receptor, but without activating it. This is somewhat like the way in which the wrong key, if it is like enough to the one that opens the lock, may jam the lock and prevent it from opening. This probably explains why, for example, the S (or left-hand) enantiomer, escitalopram, is a much more effective antidepressant than the racemic drug, citalopram.

72 McGinn 1995.

73 Schrödinger 1967a (122): ‘We are faced with the following remarkable situation. While the stuff from which our world picture is built is yielded exclusively from the sense organs as organs of the mind, so that every man’s world picture is and always remains a construct of his mind and cannot be proved to have any other existence, yet the conscious mind itself remains a stranger within that construct, it has no living space in it, you can spot it nowhere in space. We do not usually realise this fact, because we have entirely taken to thinking of the personality of a human being, or for that matter also that of an animal, as located in the interior of its body. To learn that it cannot really be found there is so amazing that it meets with doubt and hesitation, we are very loath to admit it’.

74 *ibid* (121).

75 Planck 1931a. A revealing story: I found this missing from Max Planck’s Wikiquote page. Looking up the editorial discussion page (en.wikiquote.org/wiki/Talk:Max_Planck), I found the following: ‘Dear Editors and Readers, I have removed the following citation [there follows this quote *verbatim*]. Rational [*sic*]: I checked this citation in its source – that is, on page 17 in the January 25, 1931 issue of the newspaper *The Observer* in the article entitled “Interviews with Great Scientists – VI. – Max Planck”, in the digital archive of *The Guardian and Observer*, and this citation has proved to be false ... The file I attached to my letters contains a detailed reasoning.’ However, another reader wrote: ‘Dear all. I took the liberty of double checking in *The Observer*, 25 January, 1931, p.17 ...The interview by J. W. N. Sullivan does indeed include the said quote, *verbatim*, in the second column! (Copy available on request.) I therefore request that the quote be reinstated on the page...’ It had not been reinstated. I checked for myself and found the quotation, *verbatim*, just where the previous commentator had described, except that it was in column 3. I therefore reinstated it.

76 Planck 1944: » *Als Physiker, also als Mann, der sein ganzes Leben der nüchternen Wissenschaft, nämlich der Erforschung der Materie diene, bin ich sicher frei davon, für einen Schwarmgeist gehalten zu werden. Und so sage ich Ihnen nach meiner Erforschung des Atoms dieses: Es gibt keine Materie an sich! Alle Materie entsteht und besteht nur durch eine Kraft, welche die Atomteilchen in Schwingung bringt und sie zum winzigsten Sonnensystem des Atoms zusammenhält ... so müssen wir hinter dieser Kraft einen bewussten, intelligenten Geist annehmen.* «

- 132** *ibid.*
- 133** Shapiro 2011 (7).
- 134** Ford 2017 (280–5).
- 135** Part of the variance in numbers is due to differences in methodology, and part to do with sex differences – ‘the total glial cell numbers were 27.9 billion in females and 38.9 billion in males, and the total number of neocortical neurons 21.4 billion in females and 26.3 billion in males [a 22% increase], providing a total neuron and glial cell number of 49.3 billion for females and 65.2 billion for males [a 32% increase]’: Pelvig, Pakkenberg, Stark *et al* 2008; ‘this region [medial temporal lobe] showed 34 % more neurons in men than in women: 525.1 million against 347.4 million’: Oliveira-Pinto, Andrade-Moraes, Oliveira *et al* 2016. (Strictly speaking this is not correct: it shows, for this brain region, 34% fewer neurons in women than in men, 51% more neurons in men than women.) Interestingly, treatment of female-to-male sex change patients with testosterone causes increase, and treatment of male-to-female sex change patients with oestrogen and anti-androgens causes decrease, in cortical thickness across the brain (Zubiaurre-Elorza, Junque, Gómez-Gil *et al* 2014; Pol, Cohen-Kettenis, van Haren *et al* 2006). The lower overall estimates of 16 and 69 billion come from Suzana Herculano-Houzel’s research group: Azevedo, Carvalho, Grinberg *et al* 2009. The higher estimates are more usual in most other sources both before and since Herculano-Houzel’s study: eg, Carassiti, Altmann, Petrova *et al* 2018; Pelvig, Pakkenberg, Stark *et al* 2008; Andersen, Korbo & Pakkenberg 1992.

By a prick with a sharp lancet at a certain point, I can paralyse one-half the leaf, so that a stimulus to the other half causes no movement. It is just like dividing the spinal marrow of a frog: – no stimulus can be sent from the brain or anterior part of the spine to the hind legs; but if these latter are stimulated, they move by reflex action. I find my old results about the astonishing sensitiveness of the nervous system (!?) of *Drosera* to various stimulants fully confirmed and extended’: Darwin 1887, vol III (322: emphasis in original).

178 For an insight into some of those who don't, see an opinion piece by Lincoln Taiz and colleagues in *Trends in Plant Science*, which states that 'there is no evidence that plants require, and thus have evolved, energy-expensive mental faculties, such as consciousness, feelings, and intentionality, to survive or to reproduce' (Taiz, Alkon, Draguhn *et al* 2019). Of course this already makes numerous questionable assumptions. Taiz told *The Guardian* newspaper: 'Our criticism of the plant neurobiologists is they have failed to consider the importance of brain organisation, complexity and specialisation for the phenomenon of consciousness.' That, too, makes unnecessary assumptions. But most importantly it fails to do justice to much of the material in this chapter suggesting that, whatever our theory may dictate, the relationship between brains and consciousness is not transparent at all. As Monica Gagliano responded, 'If we think we already know how things are and fail to continuously question our own assumptions, but construct our claims on a system of beliefs we are dearly attached to, then we are in deep trouble and miss the opportunity for true scientific discovery to occur ... Miserably, this opinion piece seems yet another missed opportunity, one that makes strikingly no headway towards a better scientific understanding of what consciousness is' (Sample 2019).

222 An intriguing theory developed by Jonathan Schooler, Professor of Psychological and Brain Sciences at the University of California, Santa Barbara, and Tam Hunt, a philosopher of mind at the UCSB’s Department of Brain and Cognitive Sciences, builds on the non-controversial idea that matter and energy are oscillating fields, and indeed that all existing things, however static they may seem, are ‘just vibrations of various underlying fields’. Hunt (2018) points to the fact that these oscillations and vibrations are entrained – come into ‘synch’ – in closely coupled entities: he gives the examples of light emissions from neighbouring fireflies, neuronal firing, and the rotation of the moon in relation to its orbit. He and Schooler propose what they call a ‘resonance theory of consciousness’, adopting a panpsychist position, and positing that ‘particular linkages that allow for macro-consciousness to occur result from a shared resonance among many micro-conscious constituents’. This thesis is consonant with Sheldrake’s idea of morphogenetic fields.

226 Geuter, Koban & Wager 2017; Požgain, Požgain & Degmečić 2014.

227 Ikemi & Nakagawa 1962. The paper reports in detail a study of suggestion in 57 boys aged between 15 and 18 who were touched with a leaf of ‘lacquer tree’ or ‘wax tree’, which are both

known to cause contact dermatitis, on one arm, and with a chestnut tree, which is non-allergenic, on the other. Amongst a sub-group of 13 that were known to have had previous marked reactions to the poisonous leaves, subjects hypnotised to believe the harmless leaf was poisonous, and the poisonous leaf was harmless, in every case produced a clear reaction to the harmless leaf, and in only one case a reaction to the poisonous leaf. This study is difficult to replicate for ethical reasons, but needs replication. A highly sceptical review of reported cases up to 1963 concludes that, ‘even though the majority of these reports are grossly lacking in controls, experimental design, etc, and are subject to alternative explanations, the author concludes that skin anomalies have been produced by suggestion in some instances. Additional studies of psychogenic vascular changes add credence to the possibility of central control of these phenomena’ (Paul 1963).

- 268** Penfield & Perot 1963: examples include: (a) ‘It was like being in a dance hall, like standing in the doorway – in a gymnasium – like at the Kenwood Highschool ... If I wanted to go there it would be similar to what I heard just now’; (b) ‘Some crazy things ran through my mind; I was younger, at school. I was playing with a polo bat.’ When asked, he said he remembers doing this when going to school at about the age of 10; (c) ‘Oh, I had the same very, very familiar memory in an office somewhere. I could see the desks. I was there and someone was calling to me, a man leaning on a desk with a pencil in his hand’; (d) ‘I feel as though I was in the bathroom at school’; (e) She had heard ‘Frankie and the neighbourhood noises’. She was asked whether it seemed to her to be a memory and she replied, ‘Oh no, it seemed more real than that.’ She thought she was looking into the yard and saw as well as heard the boy; (f) ‘I hear my brother talking.’ When asked what he was saying, she said he was talking to one of his schoolmates; (g) While the electrode was held in place the patient said, ‘Something brings back a memory, I could see Seven-Up Bottling Company – Harrison Bakery.’
- 269** Such might be the case of Franco Magnani, memorialised by Oliver Sacks (1992); or of ‘HK’, who suffered a serious haemorrhage as a neonate, which left him blind, but with almost total autobiographical recall (Ally, Hussey & Donahue 2013). It is thought possible that deficits in the left temporal lobe may underlie the condition, as it may other savant syndromes: ‘the anatomic substrate for the savant syndrome may involve loss of function in the left temporal lobe with enhanced function of the posterior neocortex’ (Hou, Miller, Cummings *et al* 2000). Interestingly the original ‘Rain Man’ was able to read extremely rapidly, simultaneously scanning one page with the left eye and the other page with the right eye: he had no corpus callosum (Treffert 2009). Cf the case of CS Peirce, who reportedly could simultaneously write a question with one hand and answer it with the other (see Stigler 1992 [63]).

270 See, eg, Chrysikou, Weber & Thompson-Schill 2014; and Shimamura 2000.

271 ‘The first phase selects a possible next subjective perception on the part of the observer. This ‘possible/potential’ next perception defines a corresponding brain correlate, which has, according to the theory, a certain statistical weight. The second phase of Process 1 then reduces the material universe to two parts, one that definitely contains this brain correlate and the other that definitely does not contain this brain correlate, and it “actualises” either one part or the other. This choice made by nature between the two parts accords with a certain statistical rule known as the “Born Rule”. This Born-Rule choice is the (unique) place where “an element of chance” enters into the quantum dynamics. The preceding choice of a possible next perception reflects the history and the felt values of the observer, and is identified with what the observer feels is his or her personal subjective choice of what physical property of the observed system to probe or inquire about. No element of chance is ascribed to this choice made by an observer of a particular possible probing action’ (Stapp 2017, 8).

272 Strawson 2013. This is highly reminiscent of an equally vibrant passage in another philosopher, Bryan Magee: ‘Ordinary human beings not engaged in philosophizing take it for granted that a so-called material object is the sum total of its observable characteristics. If you say to someone, ‘How do you know I am holding a leather glove in my hand?’ he might well say with impatience, ‘Well, don’t be silly. I can see it. And here’ – reaching out ‘I can touch it and feel it. And’ – taking it and raising it to his nose – ‘I can tell from the smell that it’s leather.’ And so on and so forth. And when he had gone through every attribute of the glove that was accessible to his senses he would think there was nothing left he could say about it. It would not normally occur to him to suppose that the real glove, the glove-in-itself, was an invisible, ineffable substratum that was for ever inaccessible to his observations even though it sustained the incidental characteristics he observed. He would, on the contrary, take the glove to *be* the sum of the characteristics he could observe’ (Magee 1998a, 123–4).

- 350** Smolin 1999 (44–5).
- 351** See Rees 2015.
- 352** Hawking 1989 (126). This quote is *not* to suggest that Hawking himself favoured fine-tuning – he didn’t; but that was because he believed apparent fine-tuning could be explained by inflation. That hypothesis, in turn, is far from straightforward, however. ‘The difference between good and bad [inflation] hinges on the precise shape of the potential energy curve, which is controlled by a numerical parameter that could, in principle, take on any value whatsoever. Only an extremely narrow range of values could produce the observed temperature variation. In a typical inflationary

model, the value must be near 10⁻¹⁵ – that is, zero to 15 decimal places. A less fine-tuned choice, such as zero to only 12 or 10 or eight decimal places, would produce bad inflation: the same degree of accelerated expansion (or more) but with a large temperature variation that is inconsistent with observations ... Both sets of configurations are rare, so obtaining a flat universe is unlikely overall. Penrose’s shocking conclusion, though, was that obtaining a flat universe without inflation is much more likely than with inflation – by a factor of 10 to the googol (10¹⁰⁰) power! ... In 2008 Gary W. Gibbons of the University of Cambridge and Neil G. Turok of the Perimeter Institute for Theoretical Physics in Ontario showed that an overwhelming number of extrapolations have insignificant amounts of inflation. This conclusion is consistent with Penrose’s. Both seem counterintuitive because a flat and smooth universe is unlikely, and inflation is a powerful mechanism for obtaining the needed smoothing and flattening. Yet this advantage appears to be completely offset by the fact that the conditions for starting inflation are so improbable. When all factors are taken into account, the universe is more likely to have achieved its current conditions without inflation than with it ... [In inflation] rogue regions spawn new rogue regions, as well as new islands of matter – each a self-contained universe. The process continues ad infinitum, creating an unbounded number of islands surrounded by ever more inflating space. If you are not disturbed by this picture, don’t worry – you should not be. The disturbing news comes next ... In an eternally inflating universe, an infinite number of islands will have properties like the ones we observe, but an infinite number will not. The true outcome of inflation was best summarized by Guth: “In an eternally inflating universe, anything that can happen will happen; in fact, it will happen an infinite number of times.”... What does it mean to say that inflation makes certain predictions – that, for example, the universe is uniform or has scale-invariant fluctuations – if anything that can happen will happen an infinite number of times? And if the theory does not make testable predictions, how can cosmologists claim that the theory agrees with observations, as they routinely do? ... The oft-cited claim that cosmological data have verified the central predictions of inflationary theory is misleading, at best ... Highly improbable conditions are required to start inflation. Worse, inflation goes on eternally, producing infinitely many outcomes, so the theory makes no firm observational predictions’ (Steinhardt 2011).

370 Kimura 1994 (194): » *Wenn man irgend etwas erkennt, dort verzweigt es sich; in diesem Augenblick wird die Welt entzweigerissen ... Ich glaube, dass es auch andere Ichs wahrscheinlichkeitsmässig gibt.* «

371 A further sidelight on this comes from David Mermin's model, in which there are only correlations – no correlata. He quotes Christopher Fuchs, Professor of Physics at Boston, as suggesting that the distinction between the 'many worlds interpretation' and the 'correlations without correlata' position of Mermin is 'most succinctly expressed by characterizing many worlds as correlata without correlations' (Mermin 1998). In other words, all betweenness, or configuration of the *Gestalt*, with no entities to be fixed, in the first case; and all fixed entities, but no betweenness, or *Gestalt*, arising in the second. This too reflects the difference between right hemisphere and left hemisphere takes on reality, respectively.

107 It seems to me that this is due mainly to a loss of the sense of harmonic proportion. My choice of date refers to Britain, the first nation to industrialise: this may coincide with the date at which the first builders and designers brought up entirely in an industrialised urban society there began to influence architecture and artefacts. My sense is that, since the process of industrialisation began in other nations a little later, the birth of ugliness in other parts of the world may have been correspondingly delayed slightly. It is also worth noting that the Georgian period (that preceded this date in Britain) is particularly recognised for its beautiful architecture and artefacts, so the effect is stark. Naturally I do not intend to imply anything so absurd as that all beauty disappeared from design: just that inadvertent ugliness in design made its first significant appearance at around this point in history, and grew.

108 According to Kluge’s *Etymological Dictionary of the German Language*, the word *Gestalt* may be derived from the compound Old High German word *ungistalt* (Middle High German *ungestalt*),

meaning ‘disfigured.’ Thus the *Gestalt* is what is lost when something is ugly. I am not in a position to pass philological judgment, but I like that.

- 161** Davis and Altevogt investigated the anthropometric proportions described by Leonardo's contemporaries (ratio between height and the distance of navel from the ground) in 459 German and Indian subjects. In the Germans, they found the average to be the golden ratio precisely to three decimal places: 1.618 (100% of ϕ) with a range from 1.610 (99.5%) to 1.637 (101.2%). In the Indians, they found an average of 1.626 (100.5% of ϕ), with a range between 1.623 (100.3%) and 1.634 (100.9%), also very close to the golden ratio (Davis & Altevogt 1979). A more recent study found the same value of 1.626 (100.5% of ϕ), with a range of 1.573 (97%) and 1.671 (103.3%) in 20 Italian subjects (Iosa, Morone, Bini *et al* 2016). If this degree of precision were encountered in any other biological context, it would be considered compelling. For a review of other possible instances of ϕ in the human frame and other human phenomena, see Iosa, Morone & Paolucci 2018.

- 32 Wolf & Koonin 2007. The words are repeated in a book of which Koonin is sole author (2011).

33 *ibid.* The Darwin-Eigen spiral, or cycle, is a series of steps allowing a succession of increases in replication accuracy followed by an increase in the size of the genome. Every time the accuracy of replication is increased, it allows an increase in the amount of information coded. This, in turn, allows for the selection of an increase in accuracy, which allows more coding, which allows selection for more information, and so on. Koonin's point is that to start this process requires something that can only be generated once the process is already under way.

34 Koonin 2007 (19: appendix 1).

35 Koonin 2007 (11).

36 Hart has this to say about fine-tuning: 'Certainly all of the cosmos's exquisitely fine calibrations and consonances and exactitudes should speak powerfully to anyone who believes in a transcendent creator, and they might even have the power to make a reflective unbeliever curious about supernatural explanations. But, in the end, such arguments also remain only probabilistic, and anyone predisposed to explain them away will find plentiful ways of doing so ...': Hart 2013 (39). The best known such critic of fine-tuning is Victor Stenger, who contends that 'the claim of fine-tuning of the parameters of physics is equivalent to a claim that our languages have been fine-tuned so they have grammatical rules that are highly unlikely to have occurred naturally ... No fine tuning; units are chosen for convenience and have no fundamental significance': Stenger 2013 (48 & 50). This seems to me to mistake the representation for that which is represented. The units could have been otherwise, of course; but they refer to realities that are independent of the units, just as two languages will use different words to describe the same table and chair. It doesn't matter what symbols, concepts or terms are used: the universe would not have come into existence for there to *be* humans and their symbols, concepts and terms without the 'six numbers' of Martin Rees having the values they do. To take a homely example, a value that is clearly *not* one of those numbers, the freezing point of water is 'chosen for convenience' as 0°C, a 'number which has no fundamental significance'; it could just as easily have been, say, 32°, as it is Fahrenheit. But so what? If water didn't have the freezing point it does – however you measure it and whatever you call it – the seas might never have given rise to life.

37 Bersanelli 2011 (204: emphasis in original).

38 Lennox 2011 (53).

39 See Ellis 2011: 'All the parallel universes lie outside our horizon and remain beyond our capacity to see, now or ever, no matter how technology evolves. In fact, they are too far away to have had any influence on our universe whatsoever. That is why none of the claims made by multiverse enthusiasts can be directly substantiated.'

40 See astrophysicist Marco Bersanelli: 'Nothing really happens in a world where everything always goes on infinitely often ... We need a concept of infinity in which genuine novelty can happen': Bersanelli *op cit* (205 & 214).

47 In theory, according to cosmologist Alan Heavens (2016), Director of the Imperial Centre for Inference and Cosmology at Imperial College London, either the constant should be hundreds of orders of magnitude higher than it appears to be, or it should be zero, in which case the universe

wouldn't accelerate. But this would disagree with what astronomers have observed: 'The small – but nonzero – size of the cosmological constant is a real puzzle in cosmology'.

[60](#) Smolin 2013 (221–2).

[61](#) Watanabe 1969 (70 & 75): 'In quantum mechanics, a physical state changes according to two completely different kinds of processes. First, the state changes gradually with the course of time and following a certain differential equation termed a wave equation. This process is causal and reversible. Second, the state changes abruptly the moment the observer makes a new observation of the system. This process is statistical and irreversible. Quite naturally, the renewal of the investigation changes the knowledge of the state, and hence the state itself. It can be demonstrated that entropy is not in the least changed by the first process. (This is intimately bound up with the fact that the process of change is reversible.) On the other hand, entropy changes rapidly in the second process, and always so as to increase. This means that the act of observation itself increases the entropy: a shocking situation in the eyes of classical physicists since an objective physical measure is now closely dependent on the intervention of the observing subject. The principle of entropy is no longer a simple physical law, but must be considered as the law of the development of knowledge. In the new mechanics, entropy measures, so to speak, the degree of precision of our knowledge ... the principle of entropy applies only to the object observed by the observer. This involves two important consequences. In the first place, to speak of the entropy of the entire universe is to risk passing beyond the boundaries of science ... Secondly, the increase of entropy applies only to what is observed, and consequently not at all to the observer ... The observing self is thus always excluded from the field to which the law of entropy applies'.

[62](#) Bernard 1885 (344): « *La doctrine matérialiste est tout aussi inexacte, en ce que les agents généraux de la nature physique capables de faire apparaître les phénomènes vitaux isolément n'en expliquent pas l'ordonnance, le consensus et l'enchaînement.* »

46 Plotinus, *Enneads*, Bk V, Tractate IV, §14 (trans S MacKenna & BS Page).

47 The phrase in this form is George Steiner’s: 1978b (27).

48 Thus he spoke of *Seinsvergessenheit* and *Seinsverlassenheit*.

49 Eckermann 1970 (296): entry for 18 February 1829.

50 Whitehead 1938 (232).

51 Pieper 1998 (106).

52 Schelling, ‘Seventh Lecture’: 1856–61b (137): » *Bei jeder Erklärung ist das Erste, daß sie dem zu Erklärenden Gerechtigkeit widerfahren lasse, es nicht herabdrücke, herabdeute, verkleinere oder verstümmle, damit es leichter zu begreifen sey. Hier fragt sich nicht, welche Ansicht muß von der Erscheinung gewonnen werden, damit sie irgend einer Philosophie gemäß sich bequem erklären lasse, sondern umgekehrt, welche Philosophie wird gefordert, um dem Gegenstand gewachsen, auf gleicher Höhe mit ihm zu seyn. Nicht, wie muß das Phänomen gewendet, gedreht, vereinseitigt oder verkümmert werden, um aus Grundsätzen, die wir uns einmal vorgesetzt nicht zu überschreiten, noch*

allenfalls erklärbar zu seyn, sondern: wohin müssen unsere Gedanken sich erweitern, um mit dem Phänomen in Verhältniß zu stehen. Wer aber aus was immer für einer Ursache vor einer solchen Gedanken-Erweiterung Scheu trüge, der sollte, anstatt die Erscheinung zu seinen Begriffen herabzuziehen und zu verflachen, wenigstens so aufrichtig seyn, sie in die Zahl der Dinge zu setzen, deren es für jeden Menschen noch immer sehr viele gibt, in die Zahl der Dinge, die er nicht begreift; und wenn er unfähig ist, sich selbst zu dem den Erscheinungen Gemäßen zu erheben, sollte er wenigstens sich hüten, das ihnen völlig Unangemessene auszusprechen « (emphasis in original).

53 Eg, Heller 2011 (222: emphasis in original): ‘We collect information from inside a given spacetime (by following the behaviour of geodesics in it) to learn something about the way its structure breaks down. The *apophatic* character of our knowledge is mitigated by tracing vestiges of what we do not know in the domain open to our investigation’.

54 Plotinus *op cit*.

55 Panikkar 2001 (350–1).

56 Heschel 1955 (46).

57 Pascal 1976, §267 (Lafuma §188): « *La dernière démarche de la raison est de reconnaître qu’il y a une infinité des choses qui la surpassent. Elle n’est que faible si elle ne va jusqu’à connaître cela* ».

58 Wright 1995 (59); quoted in Zwicky 2014b, §87(b). Cf Eckhart, ‘Sermon on the Fourth Sunday after Trinity’, 1958 (194): ‘God is not found in the soul by adding anything, but by a process of subtraction’.

59 Thoreau 1906, vol 12 (371): entry for 4 October 1859 (emphasis in the original).

60 Gao & Lan 2018 (254).

61 Pieper 1990 (31).

62 Augustine, *Tractates on the Gospel of St John*: XXIX, §6 (trans P Schaff): ‘*Ergo noli quærere intelligere ut credas, sed crede ut intelligas*’.

63 Berry 2000 (35).

64 Graham 2010 (176).

65 Gaisman 2018.

66 On this I find the words of Hermann Hesse, writing just after the First World War, thought-provoking: ‘All the good in a man, for which he is praised or loved, is merely good suffering, the right kind, the living kind of suffering, a suffering to the full ... From suffering springs strength, from suffering springs health’: ‘Zarathustra’s return’ (1919; in 2018, 96 & 98).

67 Eckhart, Sermon (Pfeiffer) III: 2009 (49). Wherever I have quoted from Eckhart in this chapter I have compared the translations by Evans with those by Walshe, and have in each case used whichever seemed to me clearer. I have retained Pfeiffer’s 1857 numeration (also used in the earlier Evans translation) for ease of reference and comparison.

68 *ibid* (50).

69 Eckhart, Sermon (Pfeiffer) XLII: 2009 (237).

70 In Walshe’s translation of this Sermon (Pfeiffer IV) this passage is translated thus: ‘The only name it has is “potential receptivity” which certainly does not lack being, nor is it deficient, but it is the *potential* of receptivity in which you will be perfected ...’: 2009 (56: emphasis in original). Modern German texts, in different translations, give *die Möglichkeit des Empfangens* or *eine vermögende Empfänglichkeit*. Thus Quint, 1955: » *Ihr Name besagt nichts anderes als eine Empfänglichkeitsanlage, dies (indessen) durchaus nicht des Seins ermangelt oder entbehrt, sondern eine vermögende Empfänglichkeit, worin du vollendet werden sollst*. « This is no doubt correct, but gives an impression of greater abstraction than the Middle High German original: » *Was ist das*

dünsternuzz und das unwizzen oder wie sind sein nam? Sein namen sint nicht anders dann ein mynnecliches enpfencklicheit die dann zūmal wesens nich mangelt. Es ist auch ein möglich enpfencklicheit durch die es alles volbracht ist. « (Steer, Klimanek & Löser 2002, 427–8.) This to me has a quite different energy. First of all, unlike Quint (and Walshe following him), it speaks expressly about ‘unknowing’, *das unwizzen*, which is lost in subsequent translations into modern German and English. The word *mynneclich* is also passed over in both. Its root is *minne*, meaning primarily love (as in *die Minnesänger*, the wandering minstrels who sang of courtly love), but also remembrance. Then there is the richness of *enpfencklicheit*, which suggests, to different degrees, a complex of meaning including, along with receptivity, a sensitivity or inclination towards, attunement to, susceptibility for, a responsiveness, openness and alertness to, as well as a vulnerability and tenderness towards its object.

71 Eckhart, Sermon (Pfeiffer) VII: 2009 (73).

72 Eckhart, Sermon (Pfeiffer) IX: 2009 (86).

75 Gunaratana 2011 (132–46).

76 Earle 1981.

77 It is no coincidence that Wordsworth was Whitehead’s favourite poet, as he is mine. ‘The deepest impact on Whitehead came through the poetry of Wordsworth, which he studied throughout his life. According to his daughter’s testimony, he would read *The Prelude* almost daily “as if it were the Bible, poring over the meaning of various passages” (Wyman 1956, 283).

78 Cf Rupert Spira (2002): ‘Sacred art is work that comes from a deep desire to explore the true nature of our experience, or from an intuition of it. So if we are trying to find out who we really are and what the world really is, it makes no sense to predefine or limit either ... Sacred art takes us beyond these limitations, because it is inspired by that which is beyond them. If a work of art is inspired by these limitations it will only lead the viewer back to them. We could say that a work of art is like a pathway; it bears the signature of its origin. The senses are the medium through which we travel this path ... But true art comes from transparency, not from feelings of isolation, separation or despair. Of course, such feelings often precipitate the sort of openness and sensitivity that are the origin of creativity, but it is important to make this distinction, because without it we may think that these feelings are themselves the source of creativity and we end up with an art form that celebrates the hopeless, banal, vacuous despair of a culture whose paradigm has lost sight of the sacred, of any true enquiry into the nature of reality ...’

79 Jason Cowley (2018) on the philosopher Bryan Magee: ‘He describes sex as an “other-worldly” experience and likens its effects to that of great music, “the deepest we can penetrate into a world other than this world, the world beyond appearances”’.

80 Wordsworth, ‘Tintern Abbey’.

81 Sir Thomas Browne (*Religio Medici*, I, xvi): ‘Thus there are two Books from which I collect my Divinity; besides that written one of God, another of his servant Nature, that universal and publick Manuscript, that lies expans’d unto the Eyes of all, those that never saw him in the one, have discovered him in the other ... all things are artificiall; for Nature is the Art of God’.

82 Tillich 1958.

83 Tillich *loc cit*.

84 Nettl 1983. See also McGilchrist 2009b (77).

85 Suzuki 1999 (17). *Ba’ojing Sānmèi* is also widely known by its Japanese title, *Hōkyō Zanmai*.

86 Habermas commented on an atheist friend who nonetheless wanted a church burial: ‘the enlightened modern age has failed to find a suitable replacement for a religious way of coping with the final *rite de passage*.’ On this, Stanley Fish (2010) observed: ‘The point can be sharpened: in the context of full-bodied secularism, there would seem to be nothing to pass on to, and therefore no reason for anything like a funeral.’

87 MacGregor 2018 (10).

88 Rée 2019.

89 James 1902 (37–8).

90 Wittgenstein 1961, §6.52.

91 Rée *op cit*.

92 Panikkar 2001 (351: emphasis added).

93 This is the title of a book on the Kabbalah by Rabbi David Cooper (1997). ‘God is a verb’ is also, I should point out, the title of a slightly ghastly poem by Buckminster Fuller, which understands the phrase in its own particular way.

94 *Tao Te Ching*, §32 (trans G-F Feng & J English: emphasis added).

95 See Paul Ricoeur’s *La métaphore vive* (1975), translated as *The Rule of Metaphor* (1977) – the title thereby losing its metaphoric power.

96 As recorded in Heisenberg 1971, ‘Science and religion’: 82–92 (88).

97 *ibid* (89). He even went on to say of divine intervention, a concept on which I have to acknowledge the extent of my ignorance, that ‘we quite obviously do not refer to the scientific determination of an event, but to the meaningful connexion between this event and others or human thought. Now this intellectual connexion is as much a part of reality as scientific causality; it would be much too crude a simplification if we ascribed it exclusively to the subjective side of reality’ (91).

98 Cusanus 1985: I, 1, §4: ‘Every inquiry proceeds by means of a comparative relation, whether an easy or a difficult one. Hence, the infinite, qua infinite, is unknown; for it escapes all comparative relation.’

99 Rilke, from *Mir zur Feier: Gedichte* (composed 1897, published 1899: trans IMcG): *Ich fürchte mich so vor der Menschen Wort*.

Sie sprechen alles so deutlich aus.

Und dieses heißt Hund und jenes heißt Haus,

und hier ist der Beginn und das Ende ist dort.

Mich bangt auch ihr Sinn, ihr Spiel mit dem Spott,

sie wissen alles, was wird und war;

kein Berg ist ihnen mehr wunderbar;

ihr Garten und Gut grenzt grade an Gott.

Ich will immer warnen und wehren: Bleibt fern.

Die Dinge singen hör ich so gern.

Ihr rührt sie an: sie sind starr und stumm.

Ihr bringt mir alle die Dinge um.

100 Bartholomeus de Capua, in D Prümmer OP (ed), *Fontes vitae S Thomae Aquinatis*, Toulouse [undated: foreword, however, dated 1911], §79, 377: ‘ego adiuro te per Deum vivum omnipotentem et per fidem quam tenetis ordini nostro et per caritatem quam michi stringeris quod ea que tibi dixero

nulli reveles in vita mea ... Omnia que scripsi videntur michi palee respectu eorum que vidi et revelata sunt michi. I have preserved the unorthodox mediaeval Latin spelling.

101 As one might expect, it has been suggested that Thomas could have had a stroke. However, this is wholly unsubstantiated. Aquinas was not aphasic, and his intellectual and speech abilities remained unaltered until his death, which makes a left hemisphere stroke, as an explanation of his sudden aversion to using words, unlikely; a right hemisphere stroke would hardly have opened his eyes to what it is that language fails to capture. See Charlier, Saudamini, Lippi *et al* 2017.

102 Dyson 1958 (78).

114 From ‘The anthropic universe’ 2006: www.abc.net.au/radionational/programs/scienceshow/the-anthropic-universe/3302686 (see transcript).

115 Acts 17:28. I am grateful to Nick Spencer for pointing out that this phrase appears to originate with Epimenides’ *Cretica*, where it refers to Zeus.

116 Ingold 2006 (10: emphasis added). As Schelling understood, the distinction between humanity and the world comes very late in our history: it would be anachronistic to think of concepts which we owe to the furthest past of human history as the result of efforts of a subject to make sense of the world by holding a theory about it.

117 Not coincidentally, Paley likened the world to just such an object fallen in one’s path: ‘In crossing a heath, suppose ... I had found a watch upon the ground, and it should be inquired how the watch happened to be in that place...’

118 Men 1997, vol 2.

119 Muir 1875 (364).

120 Eckermann 1889–96, vol 6: entry for 13 February 1829. The contrast that Goethe is getting at here between *Verstand* and *Vernunft* could be rendered as the contrast between Bergson’s *intellect* and *intuition*, the Latin *ratio* and *intellectus*, Greek *dianoia* and *nous* – and, effectively, LH and RH. The slightly unsatisfactory phrase ‘intuitive reason’ is the best I can do to capture the combination of reasoning and intuiting expressed by *Vernunft*. » *Der Verstand reicht zu ihr nicht hinauf, der Mensch muss fähig sein, sich zur höchsten Vernunft erheben zu können, um an die Gottheit zu rühren, die sich in Urphänomenen, physischen wie sittlichen, offenbaret, hinter denen sie sich hält und die von ihr ausgehen. Die Gottheit aber ist wirksam im Lebendigen, aber nicht im Toten; sie ist im Werdenden*

und sich Verwandelnden, aber nicht im Gewordenen und Erstarrten. Deshalb hat auch die Vernunft in ihrer Tendenz zum Göttlichen es nur mit dem Werdenden, Lebendigen zu tun, der Verstand mit dem Gewordenen, Erstarrten, dass er es nutze. «

121 Drob 1997. *Keter* is the highest of the *Sefirot*.

122 These words are repeated after every day's work, except for the second day. But as has been pointed out, on this day, uniquely, God did not create, but rather divided what had already been created.

123 Quite why this happened reveals the treachery of language. 'Why had the Authorised Version plumped for "was made"? Because in Latin, "I become" is *fio*, whose past tense is *factus sum*', writes Lucas. The point is that the translators of the Authorised Version of the Bible where possible followed earlier translations, which in turn had been made from the Latin Vulgate. The paper was privately communicated to me, and is not, as far as I know, published: before he died Lucas gave me permission to quote from it and to make it available on my website.

124 Radler 2010.

125 Eckhart, Sermon (Pfeiffer) XXVI: 1931–47, vol 1 (76). I gratefully acknowledge Professor Charlotte Radler's help.

126 I cannot trace the origin of this exact phrase, though it is frequently repeated in anthologies, and expresses well what Eckhart never formulated quite so succinctly. The closest would seem to be in Sermon (Pfeiffer) LXXXV: 'God has been begetting his only-begotten Son and is giving birth to him ... now and eternally, he, like any woman, being brought to bed in every virtuous soul who has embarked on the interior life ... What does it profit me the Father's giving his Son birth unless I bear him too? God begets his Son in the perfect soul and is brought to bed therein that she may bring him forth in all her works': 1931–47, vol 1 (216). There are also parallels in 'The nature of the soul ... want[s] to have God begotten in her': Sermon (Pfeiffer) XX: 1931–47, vol 1 (65); and 'He *must* be born in you' (Sermon 24a [no Pfeiffer equivalent], 2009 (160). I am grateful to Professor Bernard McGinn, Dr Rebecca Stephens and Fr Richard Woods OP for their advice here.

127 Mechthild of Magdeburg 2012.

128 Eckhart, Sermon (Pfeiffer) LXVI: 1931–47, vol 1 (164); and cf 'God makes the world and all things in this present now': Sermon (Pfeiffer) LXXXIII, *ibid* (209).

129 See below; and lecture by this author, entitled 'Wanting and longing' delivered at Heythrop College, 7 March 2017: www.youtube.com/watch?v=ISiKK2x4LJg (accessed 15 March 2021).

130 Boehme 1920: 'The Fourth Text', §9 and §1. Rückert's lines addressed to his beloved, and set to music by Schubert in 'Du bist die Ruh', come to mind: » *Die Sehnsucht du, und was sie stillt. «*

131 Emerson 1836 (13).

132 From a marginal note by Coleridge, contrasting Shakespeare with Beaumont and Fletcher, made between 1815 & 1819 in a copy of *The Dramatic Works of Ben Jonson, Beaumont and Fletcher*, 1811: in Raysor 1936 (88–9: emphasis in original).

133 Coleridge 1987, vol II (495).

134 Nuttall 2007 (181).

135 Coleridge 1817, vol II (20).

136 Coleridge 1856, lecture IX (107).

137 OED: 'If ... the filaments ... are free and distinct, but the anthers are connected together, so as to form one body, then your plant will be found in the class syngenesia': taken from Jean-Jacques Rousseau's *Letters on the Elements of Botany*, as translated by Thomas Martyn, 1794 (94).

138 Coleridge 1987, vol II (151).

- 139** Coleridge 1817, vol II (22).
- 140** Coleridge 1987, vol I (69).
- 141** Coleridge 1962, §2086.
- 142** Eliot, 'The three voices of poetry', in 1957 (102). I owe this connexion to Perry 1999.
- 143** Coleridge 1962, §2208 (emphasis in original).
- 144** Segall 2018 (emphasis added).
- 145** Eckhart, Sermon (Pfeiffer) XII: 2009 (101).
- 146** Whitehead 1929a (208).
- 147** *ibid* (348 & 349).
- 148** Heraclitus fr LII [Diels 84a, Marcovich 56A].
- 149** Thus Cusanus saw in God the *coincidentia* of motion and rest, 'not as two but as above duality and otherness' (Cusanus 1978b, §74).
- 150** Pauli 1994 (48: emphasis added). In a footnote to the remark about 'theory of becoming', he adds: 'One may, following [the Swiss mathematician and philosopher] F Gonseth, denote the interplay of the two aspects as "dialectical".'
- 151** Bohm 1980 (ix).
- 152** The terms he used were, respectively, *complicatio* & *explicatio*. This is not dissimilar to an idea in Eckhart, Sermon (Pfeiffer) VII: 2009 (87): 'How marvellous to be without and within, to embrace and be embraced, to see and be seen, to hold and be held – that is the goal, where the spirit is ever at rest, united in joyous eternity.'
- 153** See Whitehead 1929a (341–9): and, for discussion, Oomen 2015. This is not to be seen as two separate processes, one attributable to God, the enrichment of potential; and the other to the World, the enrichment of actualisation. Rather, the World is that aspect of God that gets to be actualised, towards which God strives just as much as to ever-renewed potential. Cf Whitehead 1933 (357): 'We must conceive the Divine Eros as the active entertainment of all ideals, with the urge to their finite realization, each in its due season. Thus a process must be inherent in God's nature, whereby his infinity is acquiring realization.'
- 154** Bond 1997 (58).
- 155** Similarly in the Kabbalah, *Ein-sof* includes within itself, although distinct, the *Sefirot*, which are modes or attributes through which God's Being is manifest in the cosmos.
- 156** *Ein-sof* should be understood as God prior to any self-manifestation: *Ein* is a negative, *sof* means grasp. This is conventionally translated as the Infinite. Is it possible that it also suggests that which cannot be grasped (or indeed that which itself *does not grasp*)?
- 157** Drob 2009 (133).
- 158** Whitehead 1929a (351).
- 159** *ibid* (342–3).
- 160** Mermin 1998 (emphasis added).
- 161** Theise & Kafatos 2016.
- 162** Miller 2017.
- 163** 'Yatha pinde tatha brahmande, yatha brahmande tatha pinde.'
- 164** Drob 1997 (emphasis added).
- 165** Whitehead 1929a (28).

166 Bohm 1989.

167 See, eg, Currivan 2017.

168 See, eg, Beck 1969 (58).

169 William Earle, describing what he calls the Technical Philosopher of the mid-twentieth century, writes that he ‘is the point of pure negativity, an eye which would like to see pure light but *cannot because of visible things*’ (Earle 1960, 374: emphasis added).

170 Goethe, ‘Epirrhema’. Hadot has written well of Goethe and this ‘open secret’: see Hadot 2006, esp ch 9, ‘Isis has no veils’, 247–61. One of Hadot’s phrases is especially apt: ‘if Isis is without veils, it is because she is entirely form, that is, entirely veil; she is inseparable from her veils and her forms’ (259).

171 *Tao Te Ching*, §1 (trans G-F Feng).

172 *De visione Dei*, ch ix, §36, lines 1–3: ‘*Unde experior, quomodo necesse est me intrare caliginem et admittere coincidentiam oppositorum super omnem capacitatem rationis et quærere ibi veritatem, ubi occurrit impossibilitas*’; and ch x, §40, lines 1–2: ‘*Unde in ostio coincidentiae oppositorum, quod angelus custodit in ingressu paradisi constitutus, te, domine, videre*’ (translations from Cusanus 1960, 43 & 46).

173 Dionysius 1923 (9 & 12). Cf Thomas Merton’s ‘Prayer before Midnight Mass’, Christmas 1941: ‘Your brightness is my darkness. I know nothing of You and, by myself, I cannot even imagine how to go about knowing You. If I imagine You, I am mistaken. If I understand You, I am deluded. If I am conscious and certain I know You, I am crazy. The darkness is enough.’

174 Henry Vaughan, ‘The Night’.

225 Drob 1997.

226 *ibid.*

227 Drob himself (*ibid*) makes this connexion.

228 Kolakowski 1985 (64).

229 Teilhard de Chardin 1960 (99). Cf Stephen Batchelor 2016 (231): ‘The mystical does not transcend the world but saturates it’.

230 Genesis 28:16.

231 Eckhart, Sermon (Pfeiffer) LXXXII: 1931–47, vol 1 (206).

232 The physical universe of measurement is incommensurate with the universe of consciousness. So Eckhart: ‘The least of the powers of my soul is wider than the expanse of heaven’: Sermon (Pfeiffer) XXIX: 2009 (178).

233 That is of course a matter of debate, but I believe the effects of religion overall outweigh whatever is alleged against it, a topic that would require, and has had, dispassionate book-length treatment: see, eg, Shortt 2019a, entitled *Does Religion Do More Harm Than Good?*

234 This is how it is normally rendered. However, Eckhart writes: ‘If anyone were to rob God of loving the soul, he would rob Him of His life and being, or he would kill God, if one may say so; for the self-same love with which God loves the soul is His life...’ Sermon (Pfeiffer) XLII: 2009 (234). This translation follows the German more closely than the Evans [1857] translation I have used elsewhere: » *Der daz gote benæme, daz er die sêle niht enminnete, der benæme im sîn leben und sîn wesen, oder er tôte got, ob man daz sprechen sölte; wan diu selbe minne, dâ mite got die sêle minnet, daz ist sîn leben.* «

235 Eckhart, Sermon (Pfeiffer) V: 1931–47, vol 1 (62). See also: ‘God can no more do without us than we without Him, for even if we were able to turn from God, God still could not turn from us ... he is of such nature and essence that he *must* give. He who would deprive God of this would deprive him of his own being, of his very life’: Sermon (Pfeiffer) XI: 2009 (98).

236 Heidegger 1975a (9).

237 Heidegger 1975c, Epilogue to ‘The thing’ (186).

238 Cf Nietzsche 2012 (4): ‘the pride connected with knowing and sensing lies like a blinding fog over the eyes and senses of men’.

239 Whitehead 1938 (121).

241 Schelling, ‘Hegel’: 1966 (163: emphasis in original): » *Die ganze Welt liegt gleichsam in den Netzen des Verstandes oder der Vernunft, aber die Frage ist eben, wie sie in diese Netze gekommen sei, da in der Welt offenbar noch etwas anderes und etwas mehr als bloße Vernunft ist, ja sogar etwas über diese Schranken Hinausstrebendes.* «

242 Sinclair 1876 (382): ‘It is generally, although erroneously, supposed that the doctrine of the Trinity is of Christian origin. Nearly every nation of antiquity possessed a similar doctrine. St Jerome testifies unequivocally, “All the ancient nations believed in the Trinity”’. An image of the Trinity that helps me is that of a book. What is the book? Is it what was present in the mind of its writer? Or the tangible volume on the table in front of me? Or what goes on in the mind of the receptive reader? Clearly it is each and all.

243 I refer to the ‘*filioque* clause’. The original creed, compiled in the fourth century by the First Council of Constantinople, asserts that the Holy Spirit emanates from God the Father. The Western Church from the eleventh century added the phrase *filioque*, ‘and from the Son’.

244 Moltmann 1993 (98).

245 McGilchrist 2009b (314–29).

251 Kierkegaard 1988 (119).

252 Grayling 2009/10.

253 Rée 2013. Grayling certainly loves certitude. In a piece entitled ‘Probably a ridiculous caveat’, about the ‘atheist bus campaign’ (to which the last sentence of Rée’s piece above obliquely refers), Grayling wrote: ‘I was not happy about the word “probably” in the slogan “There is probably no God”. I would question the rationality of anyone who thought that there is probably no Father Christmas, or probably no fairies at the bottom of the garden, etcetera, and since such beliefs and beliefs in the gods of Olympus and Ararat and all other religions are on a par, there is no “probably” about it’ (Grayling 2009). The campaign, backed by Richard Dawkins and The British Humanist Association, took place in 2008–9, and involved advertisements on public transport stating: ‘There’s probably no god. Now stop worrying and enjoy your life.’ The assumption that God must interfere with the enjoyment of life is odd (though God might consider really spoiling your fun in an afterlife, I suppose). As Harold Bloom put it, ‘It’s no fun being an atheist’ (Bloom 2005). The evidence appears to be, by contrast, that religious people are very considerably happier, healthier, both physically and mentally, less lonely, more fulfilled and longer-lived than others (see Klein, Keller, Silver *et al* 2016). Not, of course, that that is a sufficient reason for believing.

254 Harris 2005.

255 *ibid.*

259 Stump 2010 (25).

260 James 1902 (35).

261 Although some people who do not identify as atheists want to include themselves among ‘Brights’, the history of the term clarifies its import. According to Wikipedia, Paul Geisert, who coined the term ‘Bright’ and co-founded the Bright Movement, is a one-time Chicago biology teacher, professor, entrepreneur and writer of learning materials. In deciding to attend the Godless Americans March on Washington in 2002, Geisert disliked the label ‘godless’ because he thought it would alienate the general public to whom that term was synonymous with ‘evil’. He sought a new, positive word that might become well-accepted and improve the image of those who did not believe in the supernatural, in the same way that the term ‘gay’ did. A few weeks later, Geisert came up with the noun ‘bright’ after brainstorming lots of ideas. He then ran into another room and told his wife: ‘I’ve got the word, and this is going to be big!’ Their self-identified numbers include Richard Dawkins, Steven Pinker and Daniel Dennett: en.wikipedia.org/wiki/Brights_movement.

262 Steiner 2004 (2).

263 *ibid* (4–5: emphasis in original).

264 Cf Schiller 1891 (268): ‘It is a mistake to suppose that all things require to be proved, for proof is an activity of thought, and thought does not constitute the whole of consciousness. A fact may be as surely attested by feeling or will, as by the most rigorous demonstration, and ultimately all demonstration rests on such self-evident facts’.

265 Huxley 1893 (245).

266 Steven Pinker calls it ‘timely and important’ and ‘superb’, and says that it is ‘clear and gripping, and should be read by anyone interested in the tension between science and religion’; Richard Dawkins calls it ‘outstandingly good’, and says ‘it’s hard to see how any reasonable person can resist the conclusions of his superbly argued book’; and Sam Harris calls it ‘a profound and lovely book [that] should be required reading at every college on earth’.

267 Hudson 1968 (58).

284 Dawkins 2003 (198).

285 Medawar 1988 (66).

286 Shalev 2002 (57–61). Religious beliefs are broken down into 25 categories, though these include Buddhism (1.2%) and neo-paganism (0.2%), which though treated as religions, are not conventionally associated with the idea of God. (However, on Buddhism, see Shaku 2017 (25): ‘At the outset, let me state that Buddhism is not atheistic as the term is ordinarily understood. It has certainly a God, the highest reality and truth, through which and in which this universe exists.’) On everyday scientists, see 2009 Pew Research Center poll: 48% describe themselves as ‘atheist, agnostic or nothing in particular’.

287 Elmhirst 2015.

341 Frankl 2019 (50–1).

342 From ‘Eins und Alles’: » *Wirkt ewiges lebendiges Tun ... Es soll sich regen, schaffend handeln, / Erst sich gestalten, dann verwandeln; / Nur scheinbar steht’s Momente still. / Das Ewige regt sich fort in allen: / Denn alles muß in Nichts zerfallen, / Wenn es im Sein beharren will* « – ‘An eternal living force ... that cannot but move, cannot but act to create, first to form, and then to transform, itself; its moments of rest are only apparent. The eternal presses onward in all things: for all that is to persist in being must dissolve to nothing.’

343 Eliade 1978 (205–7).

344 From ‘Die selige Sehnsucht’: » ... *so lang du das nicht hast, / Dieses: Stirb und werde! / Bist du nur ein trüber Gast / Auf der dunklen Erde.* « Goethe’s expression is compressed and has foxed translators. My translation is not quite literal, but I believe it is as close as can be managed while capturing Goethe’s meaning.

345 Drob 2009 (130–1).

346 Zohar II: 173b: in Lachower & Tishby 1991, vol 2 (468).

347 Shakespeare, *As You Like It*, Act II, sc I, lines 14–19.

348 Cilliers 1998 (94–5).

349 Nietzsche 2001, §338 (192: emphasis in original).

350 Le Guin 1973. The idea was prompted by a famous passage in William James’s lecture of 1891, ‘The moral philosopher and the moral life’ (James 1897, 184–215).

351 Sikka 1994 (426): ‘Evil is thus nothing merely negative. It is positive discord, arising when the part strives to be the whole, when a particular will opposes itself to the universal will by seeking to be the creative ground of all reality. It then seeks to usurp the place of God, who is that ground, and does so by perversely asserting its own existence in opposition to, rather than in harmony with, the existence of other natures and other beings. It is not limitation that is evil, then, but the refusal, on the part of a finite being, to accept limitation’.

352 Jung 1961 (235).

353 Calder 2018.

354 According to the *Zohar* (I: 205a), God ‘made a Right and a Left for the ruling of the world. The one is called “good”, the other “evil”, and he made man to be a combination of the two.’

355 Watts 1963 (9). See also Wilber 2001 (30).

356 Drob 2000. The resonances with the Japanese concept of *kintsugi* are impossible to ignore (see Plate 22[c]). That one is a spiritual concept and the other an aesthetic concept should not, of itself, perturb a reader who has accompanied me this far.

357 *ibid.*

358 This is also the message of *I Ching*: that the Creative and the Receptive must work together, but always with the Receptive serving the Creative. ‘For the Receptive must be *activated and led* by the Creative; then it is productive of good. *Only when it abandons this position and tries to stand as an equal* side by side with the Creative, does it become evil. The result then is opposition to and struggle against the Creative, which is productive of evil to both.’ *I Ching* 1968 (11), commentary on hexagram 2: K’un. I am grateful to Stephen Lowy for bringing this, and the other references to *I Ching* that follow, to my notice.

EPILOGUE

1 Percy 1983 (76).

2 Hexagram 12: P'i – Stagnation (the exact opposite of hexagram 11: T'ai – Peace). Commentary on the Decision: 'Evil people of the time of standstill do not further the perseverance of the superior man. The great departs; the small approaches. Thus heaven and earth do not unite, and all beings fail to achieve union. Upper and lower do not unite, and in the world, states go down to ruin. The shadowy is within, the light without; weakness is within, firmness without; the inferior is within, the superior without. The way of the inferior is waxing, the way of the superior is waning' (trans R Wilhelm).

3 Benjamin 1995 (650).

4 For one another, see McGilchrist 2009b (esp 434–6); for a divine realm, see Appendix 8, section 4.

5 *The Secret of the Golden Flower*, Bk II, §5: 1991 (14).

6 Commentary on the above: 1991 (78). (Cleary correctly uses the less familiar Chinese term 'Chan' for what the reader will probably know by its Japanese appellation, 'Zen'. I have changed the term in the interests of a readier understanding.) I am grateful to Professor Kenneth Wilson for bringing this passage to my attention.

7 *ibid.*

8 *The Secret of the Golden Flower*, 'Translator's afterword': 1991 (138–9: emphasis added).

9 Heidegger 1975a (8).

10 Rigid views, regardless of political orientation to right or left, are associated with extreme cognitive inflexibility (Zmigrod, Rentfrow & Robbins 2020).

11 Bohm 1994 (10–11: emphasis in original).

12 *ibid* (55).

13 Williams, Dunning & Kruger 2013: 'In 6 studies, participants completed tests involving logical reasoning, intuitive physics, or financial investment. Those more consistent in their approach to the task rated their performances more positively, including those consistently pursuing the wrong rule. Indeed, completely consistent but wrong participants thought almost as highly of their performance as did completely consistent and correct participants. Participants were largely aware of the rules they followed and became more confident in their performance when induced to be more systematic in their approach, no matter how misguided that approach was.'

14 Wilhelm & Wilhelm 1995 (75: emphasis added).

15 Schrödinger, writing in July 1918; quoted in Moore 1992 (113).

16 Elias 1991 (32–3).

17 Frankl 2019 (55).

18 Frank 1946 (emphasis in original).

19 According to Idries Shah, 'it also appears in Rumi's work and again and again in oral legends of Jesus, of which there are a large number.' In a tale of the Sufi dervishes, Isa (Jesus) is besieged by some followers who beg from him the secret name by which Isa restored the dead to life. Not being fitted for such knowledge, they 'make a trial' of the Word on a heap of bleached bones in the desert: immediately a ravenous wild beast comes to life and tears them to shreds (Shah 2016, 138–9).

20 Dimond 1979c (216: emphasis added).

21 Bohm 1994 (3–6: emphasis in original).

22 That is to say, knowledge as understood by the left hemisphere.

23 Rilke, *Die Sonette an Orpheus*, II, 10; and it carries on: ‘But existence is still enchanted for us; it wells up in a hundred places. A play of pure forces, that no one can touch who does not kneel and adore. Words falter, in delicacy, before the ineffable ... And music, ever new, builds from the most tremulous stones, in space that can never be made useful, its divinely hallowed home.’

Alles Erworbene bedroht die Maschine, solange

sie sich erdreistet, im Geist, statt im Gehorchen, zu sein.

Daß nicht der herrlichen Hand schöneres Zögern mehr prange,

zu dem entschlossenern Bau schneidet sie steifer den Stein.

Nirgends bleibt sie zurück, daß wir ihr ein Mal entrönnen

und sie in stiller Fabrik ölend sich selber gehört.

Sie ist das Leben, – sie meint es am besten zu können,

die mit dem gleichen Entschluß ordnet und schafft und zerstört.

Aber noch ist uns das Dasein verzaubert; an hundert

Stellen ist es noch Ursprung. Ein Spielen von reinen

Kräften, die keiner berührt, der nicht kniet und bewundert.

Worte gehen noch zart am Unsäglichen aus ...

Und die Musik, immer neu, aus den bebendsten Steinen,

baut im unbrauchbaren Raum ihr vergöttlichtes Haus.

24 Lawrence 1980 (207: emphasis added).

25 Lawrence 1961 (202).

26 Chargaff 1976

27 Depression: see Wood & Joseph 2010; mortality: see meta-analysis of 62 papers, studying a total of 1,259,949 subjects, by Martín-María, Miret, Caballero et al 2017; and more recently Becchetti, Bachelet & Pisani 2019; lateralisation: while hedonic happiness shows no significant lateralisation, eudaimonic happiness is, as expected, more dependent on the right hemisphere (Costa, Suardi, Diano et al 2019; Lewis, Kanai, Rees et al 2014).

28 Hofstede 2011.

29 See McGilchrist 2009b (434ff) for references.

30 Stevenson & Wolfers 2009.

31 Report of the Office of National Statistics, ‘Suicides in the UK: 2018 registrations’, 3 September 2009.

32 Rates of depression differ markedly between cultures, probably by as much as 12-fold, and such differences in rates of depression appear to be linked to the degree of stability and interconnectedness within a culture (Weissman, Bland, Canino et al 1996). In *The Master and his Emissary*, I cited by way of illustration the fact that rates of psychological disturbance in Mexican immigrants to the USA start at a low level, but increase in proportion to the time spent in the US. The lifetime prevalence of any mental disorder in one large study was 18% for Mexican immigrants with less than 13 years in the US, 32% for those with more than 13 years, but only for those born in the US did it approximate, at 49%, the national rate for the whole US (Vega, Kolody, Aguilar-Gaxiola 1998). What is

particularly striking is that, in a Swedish study, refugees are no more likely to attempt suicide than non-refugee migrants, and both have markedly lower rates of attempted suicide than the native population. Only with progressive acculturation do they begin to approach levels in Swedish natives (Hollander, Pitman, Sjöqvist *et al* 2020; Björkenstam, Helgesson, Amin *et al* 2020: see also Norredam, Olsbjerg, Petersen *et al* 2013; Di Thiene, Alexanderson, Tinghög *et al* 2015. Similar findings obtain in the US (Nasseri & Moulton 2011) and Canada (Kliewer & Ward 1988).

33 Twenge, Gentile, DeWall *et al* 2010.

34 Brooks 2018.

35 www.cigna.com/assets/docs/newsroom/loneliness-survey-2018-full-report.pdf (accessed 15 March 2021).

36 Webster Rudmin, Ferrada-Noli & Skolbekken 2003; Greenberg, Carey & Popper 1985; Kearl & Harris 1981; Lester 1997; Rangaswami 1996; Sinha 1988; Stack 1993.

37 Durkheim 1951.

38 Interestingly, schizophrenic subjects, who show a pattern of right hemisphere deficits, can recognise happiness or anger, but not sorrow, in another's face: Bonfils, Haas & Salyers 2019; Bonfils, Ventura, Subotnik *et al* 2019.

39 There are almost insuperable difficulties in localising the correlates of *Lebenswerte*. I know of only one, an ingenious experiment involving subjects with a phobia for snakes bringing a live snake in close proximity to their head while in a scanner – a reasonable proxy for courage – which found that the brain correlates were principally in the right hemisphere (Nili, Goldberg, Weizman *et al* 2010).

40 See McGilchrist 2009b (436–8).

41 Just walking in a forest has been shown reliably to reduce blood pressure, lower blood cortisol, strengthen immunity, and promote muscle relaxation, as well as bringing about improvements in subjective well-being, confidence and social relationships: Ives, Abson, von Wehrden *et al* 2018; Tsunetsugu, Park, Ishii *et al* 2007; Hansen, Jones & Tocchini 2017; Ideno, Hayashi, Abe *et al* 2017; Chang, Hammitt, Chen *et al* 2008; Berman & Anton 1988; Polenz & Rubitz 1977; Richardson, Cormack, McRobert *et al* 2016; Capaldi, Dopko & Zelenski 2014; Pretty 2004; Bowler, Buyung-Ali, Knight *et al* 2010; DE Aldous 2007. In one study of subjects with major depressive disorder, the effects of locale on cognitive-behavioural therapy were compared; only 5% of the control (no-treatment) group achieved remission over a four-week period, while 21% achieved remission with CBT delivered in a hospital. However, this compared with 61% of those treated in a forest setting (Kim, Lim, Chung *et al* 2009). Disconnexion from nature may lie behind a number of psychological ills of modern urban life, especially when combined with the exhaustion induced by constant artificial stimulation. Spending time in nature heals stress and causes restoration after mental fatigue: see Berto 2014 for a review. In particular, see Hartig, Evans, Jamner *et al* 2003; Ulrich, Simons, Losito *et al* 1991. It also reduces anger, aggression and fear: Ulrich 1979; Ulrich, Simons, Losito *et al* 1991; Kuo & Sullivan 2001. By contrast environments devoid of natural elements can produce anxiety, anger, and frustration: Coss 1991; Ulrich 1993. Scenes with natural landscapes produce more positive emotional effects than urban scenes with inanimate objects: Lohr & Pearson-Mims 2006. Hospital patients have better outcomes on a wide range of measures if their windows overlook trees rather than a manmade environment: Ulrich 1984; Diette, Lechtzin, Haponik *et al* 2003; Miller, Hickman & Lemasters 1992. Prisoners' health is better if their cell windows include views of farmland and trees: Moore 1981. Natural settings increase performance on tasks requiring attention and cognitive processing: in an urban setting attention is constantly aggressively captured, requiring immediate directed attention, even if only so as to avoid traffic: Berman, Jonides & Kaplan 2008; Felsten 2009; Tennessen & Cimprich 1995; Berto 2005; Kaplan & Kaplan 1989. This causes fatigue, an impoverished capacity for global attention and increased stress. It also leads ultimately to the

inability to focus, with more frequent performance errors, an inability to plan, loss of social civility and increased irritability: Kaplan 1995. A study of girls living in the same housing complex found that being in or near a natural setting increased self-control and self-discipline, improved the ability to concentrate and to delay gratification, and decreased impulsiveness: Taylor, Kuo & Sullivan 2002. Interestingly blue and green space, but blue space in particular, embodies important therapeutic qualities for older adults, which may explain why so many retire by the sea: Finlay, Franke, McKay 2015.

42 See Goethe, note 5142 above.

43 Montaigne, 'On experience' (trans M Screech): « *Laissons faire un peu à nature: elle entend mieux ses affaires que nous.* »

44 Dr Lukas Fierz, private communication. In keeping with my view that many of the phenomena of modernism reflect the culture's broader imbalance in favour of the left hemisphere (how could they avoid doing so?), Le Corbusier stated: « *L'homme marche droit parce qu'il a un but ; il sait où il va. Il a décidé d'aller quelque part et il y marche droit.* » – 'Man walks in a straight line because he has a goal; he knows where he is going. He has made up his mind to go to some particular place and he goes straight to it' (1922, 33).

45 Schelling 1985, vol 3 (629): » *Wo das Licht jener Offenbarung schwand, und die Menschen die Dinge nicht aus dem All, sondern aus einander, nicht in der Einheit, sondern in der Trennung erkennen, und ebenso sich selbst in der Vereinzelung und Absonderung von dem All begreifen wollten: da seht ihr die Wissenschaft in weiten Räumen verödet, mit großer Anstrengung geringe Fortschritte im Wachsthum der Erkenntniß, Sandkorn zu Sandkorn gezählt, um das Universum zu erbauen; ihr seht zugleich die Schönheit des Lebens verschwunden, einen wilden Krieg der Meinungen über die ersten und wichtigsten Dinge verbreitet, alles in Einzelheit zerfallen.* «

46 Sperry 1973 (209).

47 Sperry 1974b (7 & 9).

48 Fox 2011 (1).

49 Scheler 1954 (261): » *Jeder endliche Geist glaubt entweder an Gott oder an einen Götzen* «. It may be argued that Buddhism acknowledges no God; once again I would quote Shaku: Buddhism 'has certainly a God, the highest reality and truth, through which and in which this universe exists.' This is also the God of the Taoists.

50 Heschel 2005 (3).

51 Angelus Silesius, 'Beschluss', from *Cherubinischer Wandersmann*, 1657: » *Freund, es ist auch genug. Im Fall du mehr willst lesen, / So geh und werde selbst die Schrift und selbst das Wesen.* «

APPENDIX 4

1 See Ratcliffe 2015 (148).

2 *ibid* (150).

3 *ibid* (151). These ideas derive from Bergson.

4 Kornbrot, Msetfi & Grimwood 2013.

5 Mundt, Richter, van Hees *et al* 1998; Lewis 1932; Wyrick & Wyrick 1977; and Kitamura & Kumar 1982.

6 Schmidt 1987 (115).

7 Sass & Pienkos 2013b (122).

8 Jackson 1986 (383–404).

9 This is primarily from my own experience and that of my patients, but there is research that confirms it: Bubl, Kern, Ebert *et al* 2010; Bubl, Tebartz Van Elst, Gonda *et al* 2009. See also McGilchrist 2017 (2–5). As we know, depression is associated with the right hemisphere, and with the colour blue. There is a possibility that the left hemisphere prefers red, a colour favoured by people who are manic or hypomanic: Pettigrew 2001 (94); and McGilchrist 2009b (63 & 474).

10 Goethe 2006, §§779–84 (171).

11 Sass & Pienkos 2013c (140).

12 See Chapter 9.

13 For further discussion of the asymmetrical, non-dipolar, relationship between schizophrenia and depression and how they may relate, see my discussion of the matter in relation to the philosophy of Max Scheler: McGilchrist 2009a. Here I part company from Cutting, who sees a more symmetrical, dipolar, relationship between the conditions. Since the right frontal pole of the brain is in a dynamic equilibrium with its own (right) posterior cortex, on the one hand, and with the contralateral (left) frontal pole, on the other, depression is usually associated with hypofunction of either of those two areas, and its resolution with recovery of function in them. In hemisphere terms, therefore, the situation with regard to depression is not straightforward. For a more thorough exploration of this complex area in terms of laterality, see McGilchrist 2009b (62–4).

14 Cutting 2002 (158: emphasis added).

15 Tatossian 1997 (56 & 62). And see O'Connor, Berry, Lewis *et al* 2007.

- 3 Tankersley, Stowe & Huettel 2007; Montague & Chiu 2007; Morishima, Schunk, Bruhin *et al* 2012. However, things are more complex than they might seem, since right prefrontal cortex is also differentially activated when people make independent-minded, rather than interdependent-minded, assertions (Wang, Peng, Chechacz *et al* 2017). This may be because of the right hemisphere's contribution to the sense of the self as moral agent, which becomes more obvious when thinking or acting independently.

APPENDIX 8

1 Heisenberg 2001 (107, 111 & 25; emphasis added): » *Aber man muß sich doch vor allem darüber klar sein, daß in der Religion die Sprache in einer ganz anderen Weise gebraucht wird als in der Wissenschaft. Die Sprache der Religion ist mit der Sprache der Dichtung näher verwandt als mit der Sprache der Wissenschaft... es gehört zu ihren wichtigsten Aufgaben, in ihrer Sprache der Bilder und Gleichniße an den großen Zusammenhang zu erinnern ... Wir wissen, daß es sich bei der Religion um eine Sprache der Bilder und Gleichniße handeln muß, die nie genau das darstellen können, was gemeint ist ... Aber letzten Endes setzt sich doch wohl immer die zentrale Ordnung durch, das, Eine, um in der antiken Terminologie zu reden, zu dem wir in der Sprache der Religion in Beziehung treten.* «

2 Planck 1944: » *Nicht die sichtbare, aber vergängliche Materie ist das Reale, Wahre, Wirkliche, sondern der unsichtbare, unsterbliche Geist ist das Wahre! ... so scheue ich mich nicht, diesen geheimnisvollen Schöpfer so zu benennen, wie ihn alle Kulturvölker der Erde früherer Jahrtausende genannt haben: Gott. So sehen Sie, meine verehrten Freunde, wie in unseren Tagen, in denen man nicht mehr an den Geist als den Urgrund aller Schöpfung glaubt und darum in bitterer Gottesferne steht, gerade das Winzigste und Unsichtbare es ist, das die Wahrheit wieder aus dem Grabe materialistischen Stoffwahnnes herausführt und die Türe öffnet in die verlorene und vergessene Welt des Geistes.* «

3 Einstein 1999 (29).

12 Miller 2017.

13 He demonstrated the impossibility of squaring the circle, finally proven by Ferdinand von Lindemann in 1882 (*De circuli quadratura*, 1450); saw that the earth is not the centre of the universe, is not at rest, but moves round the sun, and that its poles are not fixed, as well as realising that the celestial bodies are not strictly spherical, nor their orbits circular (see Bond 1997); believed the stars were other suns that had other worlds orbiting them, and that space was infinite (*ibid*); published improvements to the Alfonsine Tables which gave a practical method to find the position of the sun, moon and planets; contributed to the development of the concepts of infinitesimal and relative motion – his writings were instrumental for Leibniz’s development of calculus (Priday 2019 (88–9)); is credited with having conducted the first modern formal biology experiment, concluding that plants absorb nourishment from the air and water – this some 150 years before van Helmont (Lieth & Whittaker 1975, 8; Krikorian & Steward 1968); and was the first to see the value of counting, rather than merely characterising, the pulse, which he proposed by weighing the quantity of water run out of a water clock while the pulse beat 100 times (Hoff 1964). Although he is sometimes credited with

being the first to use concave lenses to correct myopia, this would appear to be an overstatement (*De Beryllo*, 1458).

23 Montaigne 1991, ‘An apology for Raymond Sebond’, Bk II, §12 (505).

24 Eg, letter of Nicholas Schönberg, Cardinal of Capua, to Copernicus, 1 November 1536: ‘Some years ago word reached me concerning your proficiency, of which everybody constantly spoke. At that time I began to have a very high regard for you, and also to congratulate our contemporaries among whom you enjoyed such great prestige. For I had learned that you had not merely mastered the discoveries of the ancient astronomers uncommonly well but had also formulated a new cosmology. In it you maintain that the earth moves; that the sun occupies the lowest, and thus the central, place in the universe; that the eighth heaven remains perpetually motionless and fixed; and that, together with the elements included in its sphere, the moon, situated between the heavens of Mars and Venus, revolves around the sun in the period of a year. I have also learned that you have written an exposition of this whole system of astronomy, and have computed the planetary motions and set them down in tables, to the greatest admiration of all. Therefore with the utmost earnestness I entreat you, most learned sir, unless I inconvenience you, to communicate this discovery of yours to scholars, and at the earliest possible moment to send me your writings on the sphere of the universe together with the tables and whatever else you have that is relevant to this subject’: Copernicus 1992.

25 Freely 2014 (105–6).

26 Ronchi 2014 (47).

27 This is clearly shown in Finocchiaro’s reconstruction of the accusations against Bruno (2002); see also Blumenberg 1987.

28 Barber 1961 (596): ‘In the study of the history and sociology of science there has been a relative lack of attention to one of the interesting aspects of the social process of discovery – the resistance on the part of scientists themselves to scientific discovery ... There has been a great deal of attention paid to resistance on the part of economic, technological, religious, and ideological elements and groups outside science itself. Indeed, the tendency of such elements to resist seems sometimes to be emphasized disproportionately as against the support which they also give to science. In the matter of religion, for example, are we not all a little too much aware that religion has resisted scientific discovery, not enough aware of the large support it has given to Western science?’

29 Wilkins 2012.

30 In a YouGov Poll in 2017, 84% of those who identified as religious/spiritual in the UK rejected creationism (rejected by 92% of the population overall). Slightly confusingly, 3% of the non-religious and non-spiritual nonetheless believed in creationism, and a further 7% of that same group believed in evolution ‘guided by God’. The report’s authors conclude that ‘individuals who find it difficult to accept aspects of evolutionary science overwhelmingly see other sciences as reliable, showing similar trends in attitudes as other groups. Rejection of, or uncertainty about, aspects of

human evolution is not necessarily an issue of “religion versus evolutionary science”. Universal questions around what it is to be human and about the human experience are implicated in this rejection or uncertainty and affect people of all faiths and none’. See <https://scienceligionsspectrum.org/in-the-news/press-release-results-of-major-new-survey-on-evolution/> (accessed 15 March 2021).

43 In this connection, see Moreira-Almeida & Cardeña 2011. They find that abnormal religious experiences are distinguished from psychotic illness by being ‘related to higher levels of spirituality and better mental health, social adjustment, and well-being, rather than to pathology’. Such experiences do not lead to disturbance or suffering, are not associated with social or occupational impediments, involve insight, are compatible with religious traditions, lack psychiatric co-morbidity, and are experienced as leading to personal growth, self-integration and helping others.

ACKNOWLEDGMENTS

I started working on this book in 2011; and I have had much encouragement from colleagues, friends and (though they may not be aware of it) many kind readers of *The Master and his Emissary* who have taken the trouble to write to me, over the intervening period. My main debt, though, has undoubtedly been to two people in particular, both of whom have given so generously, so freely, of their time that I can scarcely find words to convey my gratitude. Jan Zwicky combines the acumen of an experienced academic philosopher with the wisdom that comes from a life well spent: a rare gift. The time she has devoted, out of a busy schedule of her own teaching and writing, to reading and discussing the many chapters of this book has been for me, too, an immeasurable gift: one I could never have anticipated, and can never repay. John Wakefield's ability to blend intellectual penetration and shrewd judgment with never-failing good nature, even as he made his way painstakingly through so many drafts, has been a huge help and support to me: only he can know quite how much I owe him. If there is merit in this book, then, it is to them and to their many suggestions that much of it is owed: as for the rest, this thing of darkness I must acknowledge mine.

Special thanks go to Mary Attwood, Roger Elliott, Mark Tyrrell, Paul Galbraith and Ruairidh Galbraith, and all at ChannelMcGilchrist for willingly offering many hours of help, advice and support in a host of ways. Among many others to whom I am grateful for reading and commenting on parts or all of the text, or for other help and advice on particular matters, I should like to mention Mike Abramowitz, James Allsop, Robert Baldock, Niki & Max Barbery-Bleyleben, Aron Barbey, Cathérine Baxter, Will

Beharrell, Robert Bringhurst, Lance Butler, John Cottingham, Patrick Curry, John Cutting, Belinda Devenish, Ellen Dissanayake, Stefano Fait, Andreas Fink, Charles Foster, Tim Freke, Arran Gare, Jeanne-Marie Gescher, Anthony Goff, Gary Goldberg, Philip Goyal, Maya Grünschloß, Jonathan Hall, Christopher Hallpike, Laeeth Isharc, Clive Johnson, Eric Kaplan, Jürg Kesselring, Stephen Lowy, Andrew McGee, Nigel McGilchrist, Bernard McGinn, Stephen McKinnell, Julian Marshall, Andrew Milne, Peter Moran, Franck & Capucine Mourier, Ben Nelson, David Anthony Oliver, Brian Pearce, Philip Pullman, Charlotte Radler, Rupert Read, Martin Rossor, Jonathan Rowson, Louis Sass, Oliver Schultheiss, Andrew Shanks, Ronan Sharkey, Rupert Shortt, Lee Smolin, Nick Spencer, Nicky Spice, Rebecca Stephens, Julie Stone, Stephen Talbott, Rod Tweedy, Ivan Tyrell, Boris Velichkovsky, Mark Vernon, Denise Winn and Richard Woods.

I am also greatly indebted to Robert Bringhurst for the skill, care and scholarship he has brought to bear on the book's typography; and for his help, and that of Ben Rogers, with the design. Ross Loveday willingly allowed me to reproduce two of his paintings, that I am fortunate enough to own, on the covers of these volumes. Finally I am grateful to Perspectiva Press, and in particular to Jonathan Rowson and Ivo Mensch, for their enthusiasm, help and expertise in bringing this book to birth.

In addition to acknowledging purchased permissions for reproduction of both art images and material from journals, the author and publishers wish gratefully to acknowledge the generosity of Rodney A Brooks, Steve Gallik, Ron Knott, and Jason Padgett for freely permitting reproduction of their own copyright material. They are also grateful to Nigel McGilchrist for permission to use his unpublished translation of Leopardi; to Daniel Nicholson and John Dupré for permission to read their book *Everything Flows* ahead of publication; and to the Hundertwasser Non-Profit Foundation for permission to quote from a translation of Friedensreich Hundertwasser's *Die gerade Linie*.

Finally, the author and publishers acknowledge permissions received from Elsevier (Baldo *et al* 2016; Dumont *et al* 2001; Nicholson 2014; Ford

2017; Mazzucchi *et al* 2013), Karger (Bäzner *et al* 2007; Blanke 2007), Oxford University Press (McFie *et al* 1950), SAGE Publishing (Decety *et al* 2007), Springer Nature (Barbey *et al* 2013; Valladares *et al* 2004; Engerth 1933), Taylor & Francis (Brogaard *et al* 2013), Wiley & Sons (Fink *et al* 2009), Wolters Kluwer Health Inc (Schnider *et al* 1993; Regard *et al* 1994); and Collection de l'Art Brut, Lausanne ('Katharina' 1965).

Permissions for Plates are listed above under the List of Plates.

ABOUT THE AUTHOR

Dr Iain McGilchrist is a psychiatrist, neuroscience researcher, philosopher and literary scholar. He is a Quondam Fellow of All Souls College, Oxford, an Associate Fellow of Green Templeton College, Oxford, a Fellow of the Royal College of Psychiatrists, and former Consultant Psychiatrist and Clinical Director at the Bethlem Royal & Maudsley Hospital, London. He has been a Research Fellow in neuroimaging at Johns Hopkins Hospital, Baltimore and a Fellow of the Institute of Advanced Studies in Stellenbosch. He has published original articles and research papers in a wide range of publications on topics in literature, philosophy, medicine and psychiatry. He is the author of a number of books, but is best-known for *The Master and his Emissary: The Divided Brain and the Making of the Western World* (Yale 2009). He lives on the Isle of Skye, has two daughters and a son, and now grandchildren.

ABOUT PERSPECTIVA PRESS

Perspectiva is a collective of scholars, artists, activists, futurists, and seekers operating as a registered charity based in London. We believe desirable futures for humanity depend upon forms of economic restraint and political cooperation that are beyond prevailing epistemic capacities and spiritual sensibilities. Our urgent one-hundred-year project is to develop an applied philosophy of education that cultivates forms of imaginative, aesthetic and emotional capacity to help usher in a world that is, at the very least, technologically wise and ecologically sound.

As part of our contribution to education, Perspectiva Press publishes books that offer soul food for expert generalists. The idea of an expert generalist is paradoxical but not oxymoronic. In theory, our very best philosophers, civil servants, political leaders, and writers are expert generalists – their defining skill is inclusive synthesis and their defining qualities are epistemic acumen and agility: knowhow with knowledge, having enough expertise in one domain to value different forms of understanding, and knowing how to integrate them while retaining curiosity towards whatever remains unfamiliar. And soul food is called for, and not merely brain food, because we seek to revitalise and reenchant the discourse about what it means to be human, in a time when that is all too often taken for granted or explained away.
